From its dynamic start at dance parties in the South Bronx in the late 1970s, hip hop and rap music have exploded into a dominant style of popular music in the United States and a force for activism and expression all over the world. So, too, has scholarship on hip hop and rap music grown. Yet much of this scholarship, employing methods drawn from sociology and literature, leaves unaddressed the expressive musical choices made by hip hop artists. Fundamental among these choices is the rhythm of the rapping voice, termed "flow." Flow presents unique theoretical and analytical challenges. It is rhythmic in the same way other music is rhythmic, but also in the way speech and poetry are rhythmic. For the first time, Mitchell Ohriner's *Flow: The Rhythmic Voice in Rap Music* reconciles approaches to key concepts of rhythm, such as meter, periodicity, patterning, and accent, treated independently across other branches of scholarship. Ohriner theorizes flow by weaving between the methods of computational music analysis and humanistic close reading. Through the analysis of large collections of verses and individual tracks, the book addresses theories of rhythm, meter, and groove in the unique ecology of rap music. In a series of case studies in the second half, the work of Eminem clarifies how flow can relate to text, the work of Black Thought of The Roots clarifies how flow can relate to other instrumental streams, and the work of Talib Kweli clarifies how flow can relate to rap's persistent meter. While Ohriner focuses on rap music throughout the book, the methods he introduces will be useful for other musical genres that feature the voice freely interacting with a more rigid metric framework.

The region around Cincinnati, Ohio, is known throughout the world for the abundant and beautiful fossils found in limestones and shales that were deposited as sediments on the sea floor during the Ordovician Period, about 450 million years ago—some 250 million years before the dinosaurs lived. In Ordovician time, the shallow sea that covered much of what is now the North American continent teemed with marine life. The Cincinnati area has yielded some of the world's most abundant and best-preserved fossils of invertebrate animals such as trilobites, bryozoans, brachiopods, molluscs, echinoderms, and graptolites. So famous are the Ordovician fossils and rocks of the Cincinnati region that geologists use the term "Cincinnatian" for strata of the same age all over North America. This book synthesizes more than 150 years of research on this fossil treasure-trove, describing and illustrating the fossils, the life habits of the animals represented, their communities, and living relatives, as well as the nature of the rock strata in which they are found and the environmental conditions of the ancient sea.
