Book Excerpt Review, as I have said, had taken a condescending notice of Bentham in 1804. Mill tried to introduce a better tone into an article upon Bexon's Code de la Législation pénale, which he was permitted to publish in the number for October 1809. Knowing Jeffrey's 'dislike of praise,' he tried to be on his guard, and to insinuate his master's doctrine without openly expressing his enthusiasm. Jeffrey, however, sadly mangled the review, struck out every mention but one of Bentham, and there substituted words of his own for Mill's. Even as it was, Brougham pronounced the praise of Bentham to be excessive.[7] Mill continued to write for a time, partly, no doubt, with a view to Jeffrey's cheques. Almost his last article (in January 1813) was devoted to the Lancasterian controversy, in which Mill, as we shall directly see, was in alliance with the Whigs. But the Edinburgh Reviewers were too distinctly of the Whig persuasion to be congenial company for a determined Radical. They would give hi

For courses in Signals and Systems offered in departments of Electrical Engineering. This book focuses on the mathematical analysis and design of analog signal processing using a just in time approach - new ideas and topics relevant to the narrative are introduced only when needed, and no chapters are stand alone. Topics are developed throughout the narrative, and individual ideas appear frequently as needed.

This textbook is distinguished from other texts on the subject by the depth of the presentation and the discussion of the calculus of moving surfaces, which is an extension of tensor calculus to deforming manifolds. Designed for advanced

undergraduate and graduate students, this text invites its audience to take a fresh look at previously learned material through the prism of tensor calculus. Once the framework is mastered, the student is introduced to new material which includes differential geometry on manifolds, shape optimization, boundary perturbation and dynamic fluid film equations. The language of tensors, originally championed by Einstein, is as fundamental as the languages of calculus and linear algebra and is one that every technical scientist ought to speak. The tensor technique, invented at the turn of the 20th century, is now considered classical. Yet, as the author shows, it remains remarkably vital and relevant. The author's skilled lecturing capabilities are evident by the inclusion of insightful examples and a plethora of exercises. A great deal of material is devoted to the geometric fundamentals, the mechanics of change of variables, the proper use of the tensor notation and the discussion of the interplay between algebra and geometry. The early chapters have many words and few equations. The definition of a tensor comes only in Chapter 6 – when the reader is ready for it. While this text maintains a consistent level of rigor, it takes great care to avoid formalizing the subject. The last part of the textbook is devoted to the Calculus of Moving Surfaces. It is the first textbook exposition of this important technique and is one of the gems of this text. A number of exciting applications of the calculus are presented including shape optimization, boundary perturbation of boundary value problems and dynamic fluid film equations developed by the author in recent years. Furthermore, the moving surfaces framework is used to offer new derivations of classical results such as the geodesic equation and the celebrated Gauss-Bonnet theorem.

Published to commemorate an exhibition presented by Gagosian in partnership with English Heritage, this stunning volume centers on Rembrandt's masterpiece *Self-Portrait with Two Circles* (c. 1665), from the collection of Kenwood House in London. The painting is considered to be Rembrandt's greatest late self-portrait and is accompanied here by examples of the genre from leading artists of the past one hundred years. These include works by Francis Bacon, Jean-Michel Basquiat, Lucian Freud, and Pablo Picasso, as well as contemporary artists such as Georg Baselitz, Glenn Brown, Urs Fischer, Damien Hirst, Howard Hodgkin, Giuseppe Penone, Richard Prince, Cindy Sherman, and Rudolf Stingel, among

others. Also featured is a new work by Jenny Saville, created in response to Rembrandt's masterpiece. Full-color plates of the works, generous details, and installation views of the exhibition accompany an expansive essay by art historian David Freedberg that provides a close look at the self-portraits created by Rembrandt throughout his life and considers the role of the Dutch master as the precursor of all modern painting.
