Semi-active Suspension Control provides an overview of vehicle ride control employing smart semi-active damping systems. These systems are able to tune the amount of damping in response to measured vehicle-ride and handling indicators. Two physically different dampers (magnetorheological and controlled-friction) are analysed from the perspectives of mechatronics and control. Ride comfort, road holding, road damage and human-body modelling are studied. Mathematical modelling is balanced by a large and detailed section on experimental implementation, where a variety of automotive applications are described offering a well-rounded view. The implementation of control algorithms with regard to real-life engineering constraints is emphasised. The applications described include semi-active suspensions for a saloon car, seat suspensions for vehicles not equipped with a primary suspension, and control of heavy-vehicle dynamic-tyre loads to reduce road damage and improve handling.

Why do consumers pay a premium price for a brand? Is it better quality, the look and feel, or is it the brand's social standing? Author Nigel Hollis believes the answer to all those questions is "yes." Yet the vast majority of brands today

trade on past equity and transient buzz. And marketers focus on plan execution rather than creating meaningful differentiation rooted in the brand experience. This lack of meaning is creating a market full of commodities rather than products that instill loyalty. But loyalty (i.e., repeat business) is the key to long term success, and that requires focusing on meaningful differentiation: functional, emotional, or societal. Here, brand expert Nigel Hollis focuses on the four components of a meaningfully different brand: purpose, delivery, resonance, and difference. This unique model will be applied to two very different brand models: premium priced and value priced. The models will show readers how to amplify what their brand stands for across all the brand touch points including: findability, affordability, credibility, vitality, and extendibility. The book will include cases of global brands such as Dyson, Johnnie Walker, Geico, Volkswagen, and more.

In chassis development, the three aspects of safety, vehicle dynamics and ride comfort are at the top of the list of challenges to be faced. Addressing this triad of challenges becomes even more complex when the chassis is required to interact with assistance systems and other systems for fully automated driving. What is more, new demands are created by the introduction of modern electric and electronic architectures. All these requirements must be met by the chassis, together with its subsystems, the steering, brakes, tires and wheels. At the same time, all physical relationships and interactions have to be taken into account.
