The German original of this Handbook of Loss Prevention was compiled during the course of many years' work by the engineers of the Department for Engineering Insurances, the scientists of the Allianz Centre for Technology and representatives of industry. It is based on the loss experience and practical loss research studies of the Allianz over a period of more than five decades. The Handbook of Loss Prevention is a supplement to the technical literature from the field of engineering in the form of a collective work comprising examples of damage to machinery and technical plant and pertinent pointers on loss prevention. It has ranks among the recognised handbooks for engineers in the fields of planning, design, manufacture and operation. The great interest and wide acclaim according to the German edition of this handbook by industry in 1972 confirm the traditional aims of the Allianz in placing loss prevention in technical plants in the foreground of their service to clients. The English edition of the handbook under review here enables this valuable engineering know-how to be made available at international level, with the object of preventing losses by the exchange of ideas and experience. The literature references have been taken over from the German edition in unchanged form, in order to bring to the attention of English-speaking experts a bibliography, which is little known outside Germany.

Presenting current issues in electric motor design, installation, application, and performance, this second edition serves as the most authoritative and reliable guide to electric motor utilization and assessment in the commercial and industrial sectors. Covering topics ranging from motor energy and efficiency to computer-aided design and equipment selection, this reference assists professionals in all aspects of electric motor maintenance, repair, and optimization. It has been expanded by more than 40 percent to explore the most influential technologies in the field including electronic controls, superconducting generators, recent analytical tools, new computing capabilities, and special purpose motors.
