From the Preface: The appearance of Spalteholz's Atlas a few years ago was welcomed alike by teachers and students of anatomy. So useful is this book to students who desire to study anatomy in the dissecting room that without any effort on my part it has become the favorite aid to the students of anatomy at the Johns Hopkins University. Its value to English and American students not acquainted with the German language is now greatly increased through the admirable translation of the text into English by Professor Barker. The main object of studying anatomy is to obtain a mental image of the human body rather than to memorize numerous terms as is too often the case in our medical schools, especially in America. When the study of anatomy is transferred from the lecture room, text book and quiz-compend to the dissecting room it becomes one of the best disciplinary studies for medical students and at the same time gives them most useful knowledge by the inductive method of study. In the dissecting room the student obtains the greatest aid from the instructor who teaches him the art of dissection and guides him in methodical study. Next in importance is a good text book which should always be at the student's side in order that he may study the dissection of the body as it proceeds. The study of anatomy would be relatively easy were the student familiar with the subject before he begins it. The rule that the student should acquire as much knowledge as possible of a region before he begins to dissect it is good but has its limitations because it is only through the work itself that the interest of the student, and thereby his instruction, can be kept up. Just at this time an Atlas proves to be of the greatest value. Pictures of dissections, true to nature, aid the imagination of the student enormously and thus guide his work from the known to the unknown. It follows that the illustrations of an anatomical atlas must be typical, giving all stages of the dissection of the body from its beginning to its completion. The Atlas of Spalteholz meets this requirement. In addition to the superior quality of the illustrations it may be stated that they are all carefully marked with the new anatomical nomenclature. Making the anatomical terms uniform means much more than simply changing some of the names, for it brings us one step nearer to a knowledge of the normal. In casting the new nomenclature the leading anatomists of the world occupied much of their time in determining the normal and for this reason if for no other the BNA should be adopted. In the translation where the terms used are very different from the old nomenclature the latter are inserted in brackets. The Atlas speaks for itself. If its reception is as favorable generally as it has been at the Johns Hopkins University it will soon become the standard aid to our students of practical anatomy. Franklin P. Mall
