With an emphasis on the challenges of sustaining the commons across local to global scales, *Making Commons*

Dynamic examines the empirical basis of theorising the concepts of commonisation and decommonisation as a way to understand commons as a process and offers analytical directions for policy and practice that can potentially help maintain commons as commons in the future. Focusing on commonisation–decommonisation as an analytical framework useful to examine and respond to changes in the commons, the chapter contributions explore how natural resources are commonised and decommonised through the influence of multi-level internal and external drivers, and their implications for commons governance across disparate geographical and temporal contexts. It draws from a large number of geographically diverse empirical cases – 20 countries in North, South, and Central America and South- and South-East Asia. They involve a wide range of commons – related to fisheries, forests, grazing, wetlands, coastal-marine, rivers and dams, aquaculture, wildlife, tourism, groundwater, surface freshwater, mountains, small islands, social movements, and climate. The book is a transdisciplinary endeavour with contributions by scholars from geography, history, sociology, anthropology, political studies, planning, human ecology, cultural and applied ecology, environmental and development studies, environmental science and technology, public policy, Indigenous/tribal studies, Latin American and Asian studies, and environmental change and governance, and authors representing the commons community, NGOs, and policy. Contributors include academics, community members, NGOs, practitioners, and policymakers. Therefore, commonisation–decommonisation lessons drawn from these chapters are well suited for contributing to the practice, policy, and theory of the commons, both locally and globally.

"Surging sea levels are inundating the coasts." "Hurricanes and tornadoes are becoming fiercer and more frequent." "Climate change will be an economic disaster." You've heard all this presented as fact. But according to science, all of these statements are profoundly misleading. When it comes to climate change, the media, politicians, and other prominent voices have declared that "the science is settled." In reality, the long game of telephone from research to reports to the popular media is corrupted by misunderstanding and misinformation. Core questions—about the way the climate is responding to our influence, and what the impacts will be—remain largely unanswered. The climate is changing, but the why and how aren't as clear as you've probably been led to believe. Now, one of America's most distinguished

scientists is clearing away the fog to explain what science really says (and doesn't say) about our changing climate. In *Unsettled: What Climate Science Tells Us, What It Doesn't, and Why It Matters*, Steven Koonin draws upon his decades of experience—including as a top science advisor to the Obama administration—to provide up-to-date insights and expert perspective free from political agendas. Fascinating, clear-headed, and full of surprises, this book gives readers the tools to both understand the climate issue and be savvier consumers of science media in general. Koonin takes readers behind the headlines to the more nuanced science itself, showing us where it comes from and guiding us through the implications of the evidence. He dispels popular myths and unveils little-known truths: despite a dramatic rise in greenhouse gas emissions, global temperatures actually decreased from 1940 to 1970. What's more, the models we use to predict the future aren't able to accurately describe the climate of the past, suggesting they are deeply flawed. Koonin also tackles society's response to a changing climate, using data-driven analysis to explain why many proposed "solutions" would be ineffective, and discussing how alternatives like adaptation and, if necessary, geoengineering will ensure humanity continues to prosper. *Unsettled* is a reality check buoyed by hope, offering the truth about climate science that you aren't getting elsewhere—what we know, what we don't, and what it all means for our future.

With a solid understanding of science fundamentals and how the scientific method is applied, students are able to evaluate information objectively and draw their own conclusions. The text equips students to interpret the wealth of data they will encounter as citizens, professionals, and consumers.

The environment is increasingly recognized as having a powerful effect on human and ecological health, as well as on specific types of human morbidity, mortality, and disability. While the public relies heavily on federal and state regulatory agencies for protection from exposures to hazardous substances, it often looks to health professionals for information about routes of exposure and the nature and extent of associated adverse health consequences. However, most health professionals acquire only a minimal knowledge of toxicology during their education and training. In 1967 the National Library of Medicine (NLM) created an information resource, known today as the Toxicology and Environmental Health Information Program (TEHIP). In 1995 the NLM asked the Institute of Medicine to examine the accessibility and utility of the TEHIP databases for the work of health professionals. This resulting volume contains chapters on TEHIP and other toxicology and environmental health databases, on understanding the toxicology and environmental health information needs of health professionals, on increasing awareness of information resources through training and outreach, on accessing and navigating the TEHIP databases, and on program issues and future directions.
