Innovation, which in essence is the generation of knowledge and its subsequent application in the marketplace in the form of novel products and processes, has become the key concept in inquiries concerning the contemporary knowledge based economy. Geography plays a decisive role in the underlying processes that enable and support knowledge formation and diffusion activities. Place specific characteristics are considered especially important in this context, however, more recently investigation into innovative capacity of places has also turned its attention to external knowledge inputs through innovation networks, and increasingly recognize the evolutionary character of the processes that lead to knowledge creation and subsequent application in the marketplace. The chapters that comprise this book are embedded at the intersection of the dynamic processes of knowledge production and creative destruction. The first three contributions all discuss the role of global innovation networks, in the context of territorial and/or sectoral dynamics, while the following two chapters investigate the evolution of regional or metropolitan knowledge economies. The final three contributions adopt a knowledge base approach in order to provide insight into the organisation of innovation networks and spatiality of knowledge flows. This book was published in a special issue of European Planning Studies.

This thesis addresses the evolving field of measurement science, specifically that of mass spectrometry (MS) and ion mobility spectrometry (IMS) based techniques. It focuses on the design, construction and implementation of low-cost, easy-to-manufacture measurement tools that are used in modern settings such as airport security screening. Advances in these technologies often involve minimal performance enhancement at ever-increasing cost, which in turn limits accessibility to versatile measurement tools. This problem is addressed using desktop 3D printers along with widely available materials for the production of novel ion lenses and an IMS instrument with a performance comparable to that of many commercial systems. Baird ?s findings are a source of inspiration for scientists exploring this emerging field./div Autodesk Inventor® 7: Basics Through Advanced fully demonstrates the powerful abilities of the Autodesk Inventor software program. This text is written in a clear and concise manner, focusing on the highest professional standards. App Inventor 2: Databases and Files is a step-by-step guide to writing apps that use TinyDB, TinyWebDB, Fusion Tables and data files for information storage and retrieval. Includes detailed explanations, examples, and a link to download sample code. This is the first tutorial to cover all of these App Inventor database and file features. If your apps need to work with data or files - you need this book! TinyDB stores data on your smart phone or tablet and is a primary way for App Inventor apps to save data, even when the app is no longer running or if the device is turned off. TinyWebDB is similar to TinyDB, but stores your data on a remote server in the network cloud. Multiple apps can share a TinyWebDB database, plus you can update the content of your TinyWebDB using just a web browser. This means you can distribute an app whose content can change over time - just by changing the values in TinyWebDB. A big challenge is the need to set up a TinyWebDB server - this book shows how to do that through free services offered by Google. Fusion Tables provide a powerful, cloud-based database system for App Inventor apps. Creating, retrieving, updating and deleting data is done using the industry standard Structured Query Language or SQL. Fusion Tables reside in the Google network cloud - this book shows you how to set up and configure Fusion Tables for you own apps using free services of Google. As your app requirements grow, Google's cloud can provide low cost servers and bandwidth for your needs. Underneath the Android OS user interface, there is a file system, similar to the file system found on Windows or Mac OS X. With App Inventor your apps can write and read data from files, and if using the special "CSV" format, App Inventor data can be shared with many spreadsheet programs. This book shows you how to create, use and access data files, and how to convert data to and from the CSV format. Over 28,000 words. Over 250 screen shots and illustrations. Numerous sample programs and code.

iLogic enables rules-driven design, providing a simple way to capture and reuse your work. Use iLogic to standardize and automate design processes and configure your virtual products. iLogic functions iLogic embeds rules as objects directly into part, assembly, and drawing documents. The rules determine and drive parameter and attribute values for your design. By controlling these values, you can define behavior of the attributes, features, and components of a model. Knowledge is saved and stored directly in the documents, like how geometric design elements are stored. iLogic rules can utilize custom parameter types now available in Inventor, such as text, true/false, and multi-value lists. You can use these parameter types to write rules that involve more than numeric input values. The Inventor Parameters dialog box supports these specialized parameters, with advanced filtering functions to assist in parameter input definition, management, and editing.
