Since its first appearance in 1950, Pounder's Marine Diesel Engines has served seagoing engineers, students of the Certificates of Competency examinations and the marine engineering industry throughout the world. Each new edition has noted the changes in engine design and the influence of new technology and economic needs on the marine diesel engine. This eighth edition retains the directness of approach and attention to essential detail that characterized its predecessors. There are new chapters on monitoring control systems and governor systems, gas turbines and safety aspects of engine operation. Important developments such as the latest diesel-electric LNG carriers that will soon be in operation. After experience as a seagoing engineer with the British India Steam Navigation Company, Doug Woodyard held editorial positions with the Institution of Mechanical Engineers and the Institute of Marine Engineers. He subsequently edited The Motor Ship journal for eight years before becoming a freelance editor specializing in shipping, shipbuilding and marine engineering. He is currently technical editor of Seatrade, a contributing editor to Speed at Sea, Shipping World and Shipbuilder and a technical press consultant to Rolls-Royce Commercial Marine. * Designed to reflect the recent changes to SQA/Marine and Coastguard Agency Certificate of Competency exams. Careful organisation of the new edition enables readers to access the information they require * Brand new chapters focus on monitoring control systems and governor systems, gas turbines and safety aspects of engine operation * High quality, clearly labelled illustrations and figures

This book provides profound and detailed information about every kind of Marine Diesel Engines until WW I. It covers the entire range from small engines for pleasure crafts up to the largest engines for seagoing ships. With many pictures and drawings.

Pounder's Marine Diesel Engines and Gas Turbines, Tenth Edition, gives engineering cadets, marine engineers, ship operators and managers insights into currently available engines and auxiliary equipment and trends for the future. This new edition introduces new engine models that will be most commonly installed in ships over the next decade, as well as the latest legislation and pollutant emissions procedures. Since publication of the last edition in 2009, a number of emission control areas (ECAs) have been established by the International Maritime Organization (IMO) in which exhaust emissions are subject to even more stringent controls. In addition, there are now rules that affect new ships and their emission of CO₂ measured as a product of cargo carried. Provides the latest emission control technologies, such as SCR and water scrubbers Contains complete updates of legislation and pollutant emission procedures Includes the latest emission control technologies and expands upon remote monitoring and control of engines

Sir James Alfred Ewing (1855-1935) was a Scottish engineer, physicist and cryptographer. First published in 1926, as the fourth edition of an 1894 original, this book was written by Ewing 'to present the subject of heat-engines, in their mechanical as well as their thermodynamical aspects, with sufficient fulness for the ordinary needs of University students of engineering'. The text was extensively revised for this edition, taking into account developments in relation to steam turbines, steam boilers and internal combustion engines. Numerous illustrative figures are also provided. This book will be of value to anyone with an interest in Ewing's writings, steam engines and the history of engineering.

A report, submitted to the secretary of war, including a code of Panama measurement rules and a form of certificate to be issued to vessels measured for Panama canal tonnage. If you own a small marine diesel engine that you depend on--at least occasionally--this book was written for you. Nigel Calder, a diesel mechanic of many years' experience, a good writer, and perceptive teacher, has written a guide that is clear, logical, and acutally "interesting. A boatowner born with a monkey wrench in his hand will find "Marine Diesel Engines useful and agreeable; a mechanical illiterate will find it a godsend. Here in nine extensively illustrated chapters is everything you need to keep you diesel engine running cleanly and efficiently--saving you a world of frustration, discomfort, and even peril, not to mention time-and-a-half weekend mechanics' charges. "One of the best books on marine diesels to appear in some time."--"Ocean Navigator "The most up-to-date and readable book we've seen on the subject."--"Sailing World "Even if you never intend to put a spanner near your engine, and know your mechanic's home phone number by heart, this book deserves a place on any diesel-powered boat."--"Motor Boat & Yachting, London "Clear, logical, and even interesting to read."--"Cruising World Copyright © Libri GmbH. Since 1750, the world has become ever more connected, with processes of production and destruction no longer limited by land- or water-based modes of transport and communication. Volume 7 of the Cambridge World History series, divided into two books, offers a variety of angles of vision on the increasingly interconnected history of humankind. The first book examines structures, spaces, and processes within which and through which the modern world was created, including the environment, energy, technology, population, disease, law, industrialization, imperialism, decolonization, nationalism, and socialism, along with key world regions.
