The industry-standard guide to designing well-performing buildings Architectural Detailing systematically describes the principles by which good architectural details are designed. Principles are explained in brief, and backed by extensive illustrations that show you how to design details that will not leak water or air, will control the flow of heat and water vapor, will adjust to all kinds of movement, and will be easy to construct. This new third edition has been updated to conform to International Building Code 2012, and incorporates current knowledge about new material and construction technology. Sustainable design issues are integrated where relevant, and the discussion includes reviews of recent built works that extract underlying principles that can be the basis for new patterns or the alteration and addition to existing patterns. Regulatory topics are primarily focused on the US, but touch on other jurisdictions and geographic settings to give you a well-rounded perspective of the art and science of architectural detailing. In guiding a design from idea to reality, architects design a set of details that show how a structure will be put together. Good details are correct, complete, and provide accurate information to a wide variety of users. By demonstrating the use of detail patterns, this book teaches you how to design a building that will perform as well as you intend. Integrate appropriate detailing into your designs Learn the latest in materials, assemblies, and construction methods Incorporate sustainable design principles and current building codes Design buildings that perform well, age gracefully, and look great Architects understand that aesthetics are only a small fraction of good design, and that stability and functionality require a deep understanding of how things come together. Architectural Detailing helps you bring it all together with a well fleshed-out design that communicates accurately at all levels of the construction process.

A new edition of Francis D.K. Ching's illustrated guide to structural design Structures are an essential element of the building process, yet one of the most difficult concepts for architects to grasp. While structural engineers do the detailed consulting work for a project, architects should have enough knowledge of structural theory and analysis to design a building. Building Structures Illustrated takes a new approach to structural design, showing how structural systems of a building—such as an integrated assembly of elements with pattern, proportions, and scale—are related to the fundamental aspects of architectural design. The book features a one-stop guide to structural design in practice, a thorough treatment of structural design as part of the entire building process, and an overview of the historical development of architectural materials and structure. Illustrated throughout with Ching's signature line drawings, this new Second Edition is an ideal guide to structures for designers, builders, and students. Updated to include new information on building code compliance, additional learning resources, and a new glossary of terms Offers thorough coverage of formal and spatial composition, program fit, coordination with other building systems, code compliance, and much more Beautifully illustrated by the renowned Francis D.K. Ching Building Structures Illustrated, Second Edition is the ideal resource for students and professionals who want to make informed decisions on architectural design.

The Rudiment of Architectural Rendering (Pen and Ink, Colours), is a practical Architectural rendering book edited by Prof. Prabhubhai K. Patel (Emeritus Professor of Architecture from Indian Institute of Technology, Roorkee – Oldest Technical Institution of Asia). It contains about 45 illustration pictures of buildings rendered with colours, pen and ink. It is a book for Architects, Illustrators, Artists and Interior Designers. This book intended to develop a student studying architecture to demonstrate artistic skills in the core course needed to become an architect (Architectural Graphics), most especially in the application of colours. As an experience teacher of all levels of education from primary to university, believed that the daily practice of a good architect relies more on hand created drawings before it is done with the use of software. Hand created drawings gives a person training to be an architect to make use of the simplest intuitive connection between the mind and the hand. It also allows a consolidation of ideas developing the process of creative thinking. AutoCAD was created to aid architectural design for professional practice not to be a tool to develop an architect. The power of creativity relies on what you can create with your hand. An architect hand created drawing should be his pride and a manifesto to fire the imagination of his client. Even in the age of computer application, the use of hand in architectural graphics has become more precious. Using digital tools certainly has improved the way in which building design is organized and documented, but the computer cannot become a complete replacement for the way in which architects conceptualize and communicate their designs. Hand drawing is a gift that can't be ignored. We need to keep doing it. We are not machines but humans and to be an architect, one must be an artist, and to be an artist, you must be creative and to be creative you must be at one with the house. Hand drafting is an art according to Walter Gropius, says in one of his quotes, 'Children should be introduced right from the start to the potentialities of their environment, to the physical and psychological laws that govern the visual world and to the supreme enjoyment that comes from participating in the creative process of giving form to one's living space.'

This book provided for the students of architecture, interior design and civil engineering with an essential information needed to illustrate the technical drawings of any object or building. Therefore, this book developed a practical handbook for the first year students to be familiar with the alphabetic of technical drawings. It describes the range of graphic tools, techniques, and conventions that are required in technical and architectural drawings. The collected information is the authors years experience of teaching in this field. All the required information have been collected and edited in a way to have a comprehensive handbook to be applicable in one academic semester. In this regard, it might be a good textbook for the instructors who are mostly dealing with the first year students to teach them the alphabetic of technical drawing. The content of this book and its chapters classified and developed in which instructors will be able to apply the topics weekly during one academic semester. In each chapter, there are some classwork and homework for the students. Since, this book has been developed based on European Credits Transfer System (ECTS) for one academic semester, instructors may follow the proposed sequence of this book.

view of that, the objectives of this book are: To familiarize students with the basic architectural drawing techniques, equipment and applications. To develop students' ability in using drawing tools and techniques. To introduce the basic principles of drawing. To begin with the basic drawing exercises and continue with more complex studies. To understand different properties of three-dimensional objects and draw the orthographic projection. To introduce the concept of scale and dimension. To become familiar with the concept of scale and dimensioning by considering line types and line weights.

This detailed introduction to transportation engineering is designed to serve as a comprehensive text for under-graduate as well as first-year master's students in civil engineering. In order to keep the treatment focused, the emphasis is on roadways (highways) based transportation systems, from the perspective of Indian conditions.

The idea of designing, planning and building as an inseparable process The idea of "Total Architecture", as described by Ove Arup in his vision of design, continues to serve as the maxim for the globally operating engineering firm ARUP and its Building Engineering Department. Drawing on selected projects from recent years, this second volume in the new DETAIL engineering series shows how future-oriented and sustainable civil engineering can be combined with this ideal of a holistic design process - always with the aim of achieving perfect unity of strength and elegance in every structure. The focus is placed on the different processes that have accompanied the presented construction projects. Connections are shown between the individual buildings whose synergies are pursued in an exemplary fashion. The remarkable building projects reveal what continues to drive and inspire the engineers at ARUP to this day: a passion for pioneering work. ARUP over the course of time Process descriptions from the perspective of the involved architects, engineers and planners From supporting structures to light design and building services to future-oriented civil engineering Interdisciplinary thinking, planning and realization "Total Architecture": comprehensive management of building projects, from the initial designs right through to construction
