This anthology translates eighteen papers by Italian philosopher and experimental psychologist Paolo Bozzi (1930-2003), bringing his distinctive and influential ideas to an English-speaking audience for the first time. The papers cover a range of methodological and experimental questions concerning the phenomenology of perception and their theoretical implications, with each one followed by commentary from leading international experts. In his laboratory work, Bozzi investigated visual and auditory perception, such as our responses to pendular motion and bodies in freefall, afterimages, transparency effects, and grouping effects in dot lattices and among sounds (musical notes). Reflecting on the results of his enquiries against the background of traditional approaches to experimentation in these fields, Bozzi took a unique realist stance that challenges accepted approaches to perception, arguing that experimental phenomenology is neither a science of the perceptual process nor a science of the appearances; it is a science of how things are. The writings collected here offer an important resource for psychologists of perception and philosophers, as well as for researchers in cognitive science.

Zoltan J Kiss re-examines Einstein's ground-breaking work on relativity. He uncovers and resolves the significant inconsistencies which he demonstrates impose unnecessary limitations on the full flowering of the theories of relativity. The book states that the real reciprocal character is missing from the existing concept of relativity, therefore the time formula in the Special Theory is inadequate. The book also proves that there is a misunderstanding and misinterpretation on the transformation of space coordinates in the Special Theory. The energy balance approach introduced by the book shows that the collision of electromagnetic waves with inert bodies or systems of reference in acceleration in a space without gravitational field results in similar effect as Einstein a priori attributed to Gravitation. The findings of the book are questioning the foundation of the General Theory and state the Euclidean geometry still holds good, but the approach must be changed. The book offers the correct formula for the time relations of systems of reference in relative motion, characterises the unity of the mass-energy balance, defines new categories of intensity of events and event concentration, describes the motion with $v = \lim c$, the acceleration for infinite time, extends the meaning of Doppler's formula, investigates the blue and red shift of electromagnetic waves and gives the premium formula of the blue and red shift sequence for use. His energy balance approach brings Kiss to a revolutionary new definition of Gravitation, a definition which offers the world a new source of energy.

topics in quantum mechanics, general relativity, and other areas of modern physics, clearly demonstrating how they relate to advanced classical mechanics, and enabling students to appreciate the central importance of classical mechanics within contemporary fields of research. Numerous and detailed examples are interleaved with theoretical content, illustrating abstract concepts more concretely. Extensive problem sets at the end of each chapter further reinforce students' understanding of key concepts, and provide opportunities for assessment or self-testing. A detailed online solutions manual and lecture slides accompany the text for instructors. Often a flexible approach is required when teaching advanced classical mechanics, and, to facilitate this, the authors have outlined several paths instructors and students can follow through the book, depending on background knowledge and the length of their course.
