"Continuous, clean, and uninterrupted power and cooling is the lifeblood of any data center, especially one that operates 24 hours a day, 7 days a week. Critical enterprise power is the power without which an organization would quickly be unable to achieve its business objectives. Today, more than ever, enterprises of all types and sizes are demanding 24-hour system availability. This means enterprises must have 24-hour power and cooling day after day, year after year. One such example is the banking and financial services industry. Business practices mandate continuous uptime for all computer and network equipment to facilitate round-the-clock trading and banking processes anywhere, and everywhere, from any device in the world. Banking and financial service firms are completely intolerant of unscheduled downtime, given the guaranteed loss of business that invariably results. However, providing the best equipment is not enough to ensure 24-hour operation throughout the year. The goal is to achieve reliable 24-hour power, cooling, and processing at all times, regardless of the technological sophistication of the equipment or the demands placed upon that equipment by the end-user, be it business or municipality"--

The book contains 267 questions and answers for job interview for hiring on offshore drilling rigs.

The Second Edition of this introduction to fire protection systems is completely revised and updated to offer the student, architect or engineer the basics of fire protection devices and equipment, and how they may be applied to any given project. *Fire Protection: Detection, Notification, and Suppression* reveals the "nuts and bolts" of fire protection system selection, design and equipment in an applied approach. Whether a mechanical engineer, safety engineer, architect, estimator, fire service personnel, or student studying in these areas, the authors show the pros and the cons of protection systems being proposed, and how they should be compared to one another. It also gives non-fire engineering practitioners a sense of proportion when they are put in a position to select a consultant, and to give a sense of what the consultant may be doing and how a system is being matched to the hazard. Beginning fire protection engineers could also use its language for writing a report about these systems for a client.
