In Evangelist Marketing, Alex Goldfayn argues that technology companies succeed in spite of their marketing, not because of it. He says that if consumer tech makers ceased all marketing activity today, they would not see a significant decline in sales. In this book, Alex presents why the current state of overly-technical, features-oriented tech marketing, branding, communications and public relations is costing the industry billions of dollars—easy money that's voluntarily being left on the table. Then he lays out a step-by-step system for creating intensely loyal brand evangelists based on deep consumer insights and simple, emotional language. Evangelist Marketing is written for consumer tech companies big and small—from PC manufacturers to Web-based services. It's also sure to improve the work of their marketing and public relations agencies.

The proposed research can find applications in factories, oil refineries, and mines. It is essential to develop new improved methods, techniques, and devices related to mechanical engineering.

Workers' compensation was arguably the first widespread social insurance program in the United States--before social security, Medicare, or unemployment insurance--and the most successful form of labor legislation to emerge from the early progressive movement. In A Prelude to the Welfare State, Price V. Fishback and Shawn Everett Kantor challenge widespread historical perceptions by arguing that workers' compensation, rather than being an early progressive victory, succeeded because all relevant parties--labor and management, insurance companies, lawyers, and legislators--benefited from the ruling.

This volume covers the science of ALDH enzymes in relation to chronic disease processes and the future therapeutic potentials of targeting ALDH in these processes. It thoroughly reviews the roles of ALDH family in alcohol metabolism, as well as recent findings of their emerging roles in a variety of human pathologies such as cardiovascular diseases, diabetes, obesity, stroke, cancer, liver diseases and kidney diseases. Delicate contribution of ALDH enzymes in the therapeutics against chronic diseases is also discussed. It demonstrates the unique value of targeting genetic polymorphism in ALDH enzymes in personalized medicine. The book will appeal to scientists, physicians, graduate and professional students in the fields of ALDH enzymes, alcohol metabolism, cardiometabolic and other chronic diseases. Pharmaceutical and other companies developing new tools for cardiometabolic and chronic diseases treatment will also find this a valuable resource.

Every day, large quantities of volatile organic compounds (VOCs) are emitted into the atmosphere from both anthropogenic and natural sources. The formation of gaseous and particulate secondary products caused by oxidation of VOCs is one of the largest unknowns in the quantitative prediction of the earth's climate on a regional and global scale, and on the understanding of local air quality. To be able to model and control their impact, it is essential to understand the sources of VOCs, their distribution in the atmosphere and the chemical transformations which remove these compounds from the atmosphere.

In recent years techniques for the analysis of organic compounds in the atmosphere have been developed to increase the spectrum of detectable compounds and their detection limits. New methods have been introduced to increase the time resolution of those measurements and to resolve more complex mixtures of organic compounds. Volatile Organic Compounds in the Atmosphere describes the current state of knowledge of the chemistry of VOCs as well as the methods and techniques to analyse gaseous and particulate organic compounds in the atmosphere. The aim is to provide an authoritative review to address the needs of both graduate students and active researchers in the field of atmospheric chemistry research.

The future of manufacturing companies depends largely on their ability to adapt to swiftly changing global conditions. These are exemplified by international competition, rapidly growing intercommunication and the increased significance of environmental issues [KLOC98a, ENGE02]. Precision machining with geometrically undefined cutting edges represents a key production engineering technology with high efficiency, security and machining quality. DIN norm 8589 subsumes within the group "machining with geometrically - defined cutting edges" the following material removal manufacturing processes: grinding, honing, lapping, free abrasive grinding and abrasive blast cutting. - chining is carried out in these production methods by means of more or less - regularly formed grains composed of hard substances brought into contact with the material. Of all methods understood as machining with geometrically undefined cutting edges, only grinding, honing and lapping can, strictly speaking, be considered precision machining. Free abrasive grinding and abrasive blast cutting, also treated in this book, represent a special group, as they generally cannot bring about geometrical change in the material.
