Nine out of every ten medical students, residents, and fellows attempt to write a manuscript during their training. Yet, after finishing the training only 1 or 2 would continue to write scientific manuscripts due to the effort involved in preparing a manuscript. Most medical students, residents, fellows, and even junior faculty consider writing a scientific manuscript harder than working grueling hours on the clinical service. The manual of scientific manuscript writing was developed to guide for medical students, residents, fellows, and junior faculty by providing a step by step pathway for successful preparation of a manuscript. The manual is expected to reduce the usual 3 and 6 months (at times frustrating) effort to a 1 to 2 week streamlined process to complete a manuscript.

This manual is introduced globally to the ophthalmic community, with the primary focus on the practicing eye care provider, and all those involved-in, or interested-in the management of ocular diseases. Ocular management issues are complex and inter-related to basic science, and to clinical presentations of a large spectrum of ocular diseases. Of equal importance is the recognition and diagnosis of the individual patient's ocular disease state. Proper diagnosis will then channel the clinician in the correct direction to engage in the optimal management of the ocular condition, and thus relieve the patient's signs and symptoms, and possibly improve the way the patient sees the world. All these clinical activities are often performed within a very narrow time-slot, with limited chair-time for the individual patient. It is of paramount importance to maximally utilize this limited time segment to deliver the best possible care to our patients. At the same time, it is important not to compromise eye care at the expense of speed. Hence, a clinician often needs the diagnostic and therapeutic reference materials that can be used in a short time to answer his clinical question(s). With this in mind, the text is written in an easy-to-read, quick reference format, while at the same time providing an extensive, and most comprehensive material, that the clinician will find extremely useful. Also, practical images are inserted throughout the text to complement the process of clinical patient care. This book helpful for practising ophthalmologists and students.

The authors are experts from around the world, and the book will be of value both for surgeons new to this technique and for experienced surgeons who need a review of the procedure. blood donation. Each step in the process carries risks - both for patients and health workers. Patients may be bruised. Health workers may receive needle-stick injuries. Both can become infected with bloodborne organisms such as hepatitis B, HIV, syphilis or malaria. Moreover, each step affects the quality of the specimen and the diagnosis. A contaminated specimen will produce a misdiagnosis. Clerical errors can prove fatal.
