The text also boasts a wide array of coverage of ANOVA, nonparametric, MCMC, Bayesian and empirical methods; solutions to selected problems; data sets; and an image bank for students. Advanced undergraduate and graduate students taking a one or two semester mathematical statistics course will find this book extremely useful in their studies. Step-by-step procedure to solve real problems, making the topic more accessible Exercises blend theory and modern applications Practical, real-world chapter projects Provides an optional section in each chapter on using Minitab, SPSS and SAS commands Wide array of coverage of ANOVA, Nonparametric, MCMC, Bayesian and empirical methods

Noted for its integration of real-world data and case studies, this text offers sound coverage of the theoretical aspects of mathematical statistics. The authors demonstrate how and when to use statistical methods, while reinforcing the calculus that students have mastered in previous courses. Throughout the Fifth Edition, the authors have added and updated examples and case studies, while also refining existing features that show a clear path from theory to practice.

The field of industrial microbiology involves a thorough knowledge of the microbial physiology behind the processes in the large-scale, profit-oriented production of microbe-related goods which are the subject of the field. In recent times a paradigm shift has occurred, and a molecular understanding of the various processes by which plants, animals and microorganisms are manipulated is now central to industrial microbiology. Thus the various applications of industrial microbiology are covered broadly, with emphasis on the physiological and genomic principles behind these applications. Relevance of the new elements such as bioinformatics, genomics, proteomics, site-directed mutation and metabolic engineering, which have necessitated the paradigm shift in industrial microbiology are discussed.

The contemporary finance deals mainly with multilateral and multi-counterparty transactions. Islamic Jurisprudence (Fiqh) has yet to develop its conceptualization of this modality of financing. Thus far, it has become a norm for large financing projects to rely on a complex structure of interconnected bilateral contracts that in totality becomes opaque, complex and costly. An unfortunate result of the unavailability of an efficient Fiqhi model applicable to modern multilateral and multi-counterparty contracts has been the fact that the present Islamic finance has been forced to replicate conventional risk-transfer (interest rate based) debt contracts thus drawing severe criticisms of duplicating conventional finance. In 2012, a gathering of some of the Muslim world's most prominent experts in Jurisprudence (Fuqaha) and economists issued the

Kuala Lumpur Declaration (Fatwa) in which they identified risk sharing as the essence of Islamic finance. The Declaration opened the door for a new Fiqh approach to take the lead in developing the jurisprudence of multilateral and multi-counterparty transactions. This Declaration (Fatwa) provides a prime motivation to search for a comprehensive model of risk sharing that can serve as an archetypal contract encompassing all potential contemporary financial transactions. From the perspective of Islamic Jurisprudence (Fiqh), the technicalities of the concept of risk sharing in contemporary finance have yet to be defined in Islamic literature. This book attempts to clarify and shed light on these technicalities from the perspective of Fiqh. It is a comprehensive study that relies on the fundamental Islamic sources to establish a theoretical and practical perspective of Fiqh encompassing risk-sharing Islamic finance as envisioned in the Kuala Lumpur Declaration of 2012. This new paradigm should lead to a more efficient approach to multilateral and multi-counterparty Islamic contracts which, here-to-fore has been lacking in the current configuration of Islamic finance.

The emergence and refinement of techniques in molecular biology has changed our perceptions of medicine, agriculture and environmental management. Scientific breakthroughs in gene expression, protein engineering and cell fusion are being translated by a strengthening biotechnology industry into revolutionary new products and services. Many a student has been enticed by the promise of biotechnology and the excitement of being near the cutting edge of scientific advancement. However, graduates trained in molecular biology and cell manipulation soon realise that these techniques are only part of the picture. Reaping the full benefits of biotechnology requires manufacturing capability involving the large-scale processing of biological material. Increasingly, biotechnologists are being employed by companies to work in co-operation with chemical engineers to achieve pragmatic commercial goals. For many years aspects of biochemistry and molecular genetics have been included in chemical engineering curricula, yet there has been little attempt until recently to teach aspects of engineering applicable to process design to biotechnologists. This textbook is the first to present the principles of bioprocess engineering in a way that is accessible to biological scientists. Other texts on bioprocess engineering currently available assume that the reader already has engineering training. On the other hand, chemical engineering textbooks do not consider examples from bioprocessing, and are written almost exclusively with the petroleum and chemical industries in mind. This publication explains process analysis from an engineering point of view, but refers exclusively to the treatment of biological systems. Over 170 problems and worked examples encompass a wide range of applications, including recombinant cells, plant and animal cell cultures, immobilised catalysts as well as traditional fermentation systems.
