A sense of fatigue dogs the fitness world. Many of the new programs that are tagged as groundbreaking are actually recycled ideas. Foundation offers something completely different for novices and athletes alike: a simple program with powerful and proven results that will remedy bad posture, alleviate back pain, and help readers break through fitness challenges and plateaus. Dr. Eric Goodman, a brilliant and dynamic young chiropractor, teams up with Peter Park, one of the top trainers in the United States, to radically redefine the core--shifting the focus from the front of the body to the back. Their groundbreaking approach works to strengthen the lower back and the full posterior chain and correct poor movement patterns by addressing mechanical imbalances and weaknesses. Foundation training involves simple movement patterns and is equipment free, creating maximum power, flexibility, and endurance. Word-of-mouth enthusiasm has inspired both Hollywood luminaries and world-class athletes to

make Foundation training the core of their fitness programs. Eric and Peter's client list has grown exponentially to include Lance Armstrong, NBA star Derek Fisher, world-champion surfer Kelly Slater, and actor Matthew McConaughey.

Running brings joy and health benefits to all participants, especially those of the baby boomer generation. But when legs get sore, joints feel achy, and old age creeps up, sometimes senior runners need a little extra motivation to get out of the door and on the road. In *Running Past Fifty*, lifelong runner Gail Waesche Kislevitz provides helpful tips and motivation from thirty-six runners aged fifty or older. Presenting time-tested recommendations, Kislevitz interviews some of the nation's greatest senior runners. Included here are exclusive interviews with greats such as Ed Whitlock, who, at the age of eighty-five, set an age-division world record of 3:56 in the marathon; Bill Rodgers, winner of four Boston Marathons and four New York City Marathons; George Hirsch, chairman of New York Road Runners; Olympian and author Jeff Galloway; world record holder Sid Howard; and runner and women's pioneer runner and advocate Kathrine Switzer. And legendary runners aren't the only ones running well into seniority. Kislevitz also offers motivational stories from average runners who hit the pavement frequently and refuse to let their age stop them from competing regularly. Baby boomer runners may be slower than they once were, but they show no signs of slowing down. Inspiring and insightful, *Running Past Fifty* is the perfect read for every one of them.

Physical fitness affects our ability to function and be active. At poor levels, it is associated with such health outcomes as diabetes and cardiovascular disease. Physical fitness testing in American youth was established on a large scale in the 1950s with an early focus on performance-related fitness that gradually gave way to an emphasis on health-related fitness. Using appropriately selected measures to collected fitness data in youth will advance our understanding of how fitness among youth translates into better health. In *Fitness Measures and Health Outcomes in Youth*, the IOM assesses the relationship between youth fitness test items and health outcomes, recommends the best fitness test items, provides guidance for interpreting fitness scores, and provides an agenda for needed research. The report concludes that selected cardiorespiratory endurance, musculoskeletal fitness, and body composition measures should be in fitness surveys and in schools. Collecting fitness data nationally and in schools helps with setting and achieving fitness goals and priorities for public health at an individual and national level.

"This highly engaging landmark work, a natural history of exercise--by the author of the best seller *The Story of the Human Body*--seeks to answer a fundamental question: were you born to run or rest? The first three parts of *Exercised* roughly follow the evolutionary story of human physical activity and inactivity, even as each chapter shatters a particular myth about exercise. Because we cannot understand physical activity without understanding its absence, Part One begins with physical inactivity. What are our bodies doing when we take it easy, including when we sit or sleep? Part Two explores physical activities that require speed, strength, and power, such as sprinting, lifting, and fighting. Part Three surveys physical activities that involve endurance, such as walking, running, or dancing, as well as their effect on aging. Part Four considers how anthropological and evolutionary approaches can help us exercise better in the modern world. How can we more effectively manage to exercise, and in what ways? To what extent, how, and why do different types and durations of exercise

help prevent or treat the major diseases that are likely to make us sick and kill us?"-- An indispensable and insightful roadmap for women entering the shifting landscape of life in the middle decades. With balanced, accessible, and humorous discussions of female physiology and psychology as well as current treatment options, author and psychologist Deborah R. Wagner PhD, provides an insightful and inspiring forum to help her readers get comfortable with the volatile, powerful, and colorful decades of life in the forties and fifties. With added advice for families—including a segment for partners and children—as well as candid discussions on the impact of unanticipated (but interconnected) conditions such as anxiety, depression, changing body image, loss of empathy, nurturing, and empty nesting, Dr. Wagner delivers a potent blend of science and comfort in a voice that will resonate with women of all ages. The Fifth Decade provides an essential resource to women and their families experiencing the shifts that come with the midlife years.

Physical inactivity is a key determinant of health across the lifespan. A lack of

activity increases the risk of heart disease, colon and breast cancer, diabetes mellitus, hypertension, osteoporosis, anxiety and depression and others diseases. Emerging literature has suggested that in terms of mortality, the global population health burden of physical inactivity approaches that of cigarette smoking. The prevalence and substantial disease risk associated with physical inactivity has been described as a pandemic. The prevalence, health impact, and evidence of changeability all have resulted in calls for action to increase physical activity across the lifespan. In response to the need to find ways to make physical activity a health priority for youth, the Institute of Medicine's Committee on Physical Activity and Physical Education in the School Environment was formed. Its purpose was to review the current status of physical activity and physical education in the school environment, including before, during, and after school, and examine the influences of physical activity and physical education on the short and long term physical, cognitive and brain, and psychosocial health and development of children and adolescents. Educating the Student Body makes recommendations about approaches for strengthening and improving programs and policies for physical activity and physical education in the school environment. This report lays out a set of guiding principles to guide its work on these tasks. These included: recognizing the benefits of instilling life-long physical activity habits in children; the value of using systems thinking in improving physical activity and physical education in the school environment; the recognition of current disparities in opportunities and the need to achieve equity in physical activity and physical education; the importance of considering all types of school environments; the need to take into consideration the diversity of students as recommendations are developed. This report will be of interest to local and national policymakers, school officials, teachers, and the education community, researchers, professional organizations, and parents interested in physical activity, physical education, and health for school-aged children and adolescents.

Being healthy is much more than being physically fit and free from disease. Health is the state of well-being in which all of the components of health -- physical, emotional, social, mental, spiritual, and environmental -- are in balance. To be truly healthy, you must take care of all six components. - p. 11.
