As a homebuyer or seller, if you had the “inside scoop” on the home inspection process, wouldn’t that make you feel less anxious? If you’re looking to get into this line of work, this book will help you know what to expect and how to get as much information to further your career as well. Think about it like this: the buyers want you to find everything, the sellers don’t want you to find anything, the realtors don’t want the home inspector to “blow the deal”, and the home inspector, who’s in the middle, has an obligation to do a thorough and professional job and stay neutral. The home buying process is complicated enough, but being prepared, knowing what to ask, knowing what to look for in a home inspector, knowing what everyone’s roles are, that’s the easy part when you have access to the right information. If you’re going to seek advice from someone, make it someone who’s got the extensive background to be offering such advice. Read more so you can be prepared for this house, your next house, or a future career. • Know about your home inspector • Be prepared as a home buyer • Be prepared as a home seller • Be prepared as a realtor • Be prepared as a contractor • Looking into a home inspector career • Home maintenance tips

Solid waste management affects every person in the world. By 2050, the world is expected to increase waste generation by 70 percent, from 2.01 billion tonnes of waste in 2016 to 3.40 billion tonnes of waste annually. Individuals and governments make decisions about consumption and waste management that affect the daily health, productivity, and cleanliness of communities. Poorly managed waste is contaminating the world’s oceans, clogging drains and causing flooding, transmitting diseases, increasing respiratory problems, harming animals that consume waste unknowingly, and affecting economic development. Unmanaged and improperly managed waste from decades of economic growth requires urgent action at all levels of society. What a Waste 2.0: A Global Snapshot of Solid Waste Management to 2050 aggregates extensive solid waste data at the national and urban levels. It estimates and projects waste generation to 2030 and 2050. Beyond the core data metrics from waste generation to disposal, the report provides information on waste management costs, revenues, and tariffs; special wastes; regulations; public communication; administrative and operational models; and the informal sector. Solid waste management accounts for approximately 20 percent of municipal budgets in low-income countries and 10 percent of municipal budgets in middle-income countries, on average. Waste management is often under the jurisdiction of local authorities facing competing priorities and limited resources and capacities in planning, contract management, and operational monitoring. These factors make sustainable waste management a complicated proposition; most low- and middle-income countries, and their respective cities, are struggling to address these challenges. Waste management data are critical to creating policy and planning for local contexts. Understanding how much waste is generated—especially with rapid urbanization and population growth—as well as the types of waste generated helps local governments to select appropriate management methods and plan for future demand. It allows governments to design a system with a suitable number of vehicles, establish efficient routes, set targets for diversion of waste, track progress, and adapt as consumption patterns change. With accurate data, governments can realistically allocate resources, assess relevant technologies, and consider strategic partners for service provision, such as the private sector or nongovernmental organizations. What a Waste 2.0: A Global Snapshot of Solid Waste Management to 2050 provides

the most up-to-date information available to empower citizens and governments around the world to effectively address the pressing global crisis of waste. Additional information is available at <http://www.worldbank.org/what-a-waste>.

The general objective of the study is to assess the sustainability of waste management in Glendale. The researcher used case study research design in conjunction with mixed methods research in the study. Both qualitative and quantitative methodologies were used to collect data. The target population for the study consisted of residents of Valley, Westville Park and Sisk, council authorities, Environmental Management Agency (EMA) officer, waste collectors, members of community based organizations (CBOs) and the environmental health officer.
