This new edition of A Guide to Energy Management in Buildings begins by asking why we need to control energy use in buildings and proceeds to discuss how the energy consumption of a building can be assessed or estimated through an energy audit. It then details a range of interventions to reduce energy use and outlines methods of assessing the cost-effectiveness of such measures. Topics covered include: where and how energy is used in buildings energy audits measuring and monitoring energy use techniques for reducing energy use in buildings legislative issues. And new in this edition: the cooling of buildings fuel costs and smart metering and education and professional recognition. It provides a template for instigating the energy-management process within an organization, as well as guidance on management issues such as employee motivation, and gives practical details on how to carry the process through. This book should appeal to building and facilities managers and also to students of energy management modules in FE and HE courses.

The energy industry has change radically since the initial publication of this reference over 20 years ago. Looking back on the energy arena, one thing becomes clear: energy is the key element that must be managed to ensure a company's profitability. The Energy Management Handbook, Fifth Edition is the definitive reference to guide energy managers through the maze of changes the industry has experienced.

The Department of Defense (DoD) is the largest consumer of energy in the federal government. In turn, the U.S. Air Force is the largest consumer of energy in the DoD, with a total annual energy expenditure of around \$10 billion. Approximately 84 percent of Air Force energy use involves liquid fuel consumed in aviation whereas approximately 12 percent is energy (primarily electricity) used in facilities on the ground. This workshop was concerned primarily with opportunities to reduce energy consumption within Air Force facilities that employ energy intensive industrial processes-for example, assembly/disassembly, painting, metal working, and operation of radar facilities-such as those that occur in the maintenance depots and testing facilities. Air Force efforts to reduce energy consumption are driven largely by external goals and mandates derived from Congressional legislation and executive orders. To date, these goals and mandates have targeted the energy used at the building or facility level rather than in specific industrial processes. In response to a request from the Deputy Assistant Secretary of the Air Force for Energy and the Deputy Assistant Secretary of the Air Force for Science, Technology, and Engineering, the National Research Council, under the auspices of the Air Force Studies Board, formed the Committee on Energy Reduction at U.S. Air Force Facilities Using Industrial Processes: A Workshop. The terms of reference called for a committee to plan and convene one 3 day public workshop to discuss: (1) what are the current industrial processes that are least efficient and most cost ineffective? (2) what are best practices in comparable facilities for comparable processes to achieve energy efficiency? (3) what are the potential applications for the best practices to be found in comparable facilities for comparable processes to achieve energy efficiency? (4) what are constraints and considerations that might limit applicability to Air Force facilities and processes over the next ten year implementation time frame? (5) what are the costs and paybacks from implementation of the best practices? (6) what will be a proposed resulting scheme of priorities for study and implementation of the identified best practices? (7) what does a holistic representation of energy and water consumption look like within operations and maintenance?

Managing the consumption and conservation of energy in buildings is the concern of both building managers and occupants and this use accounts for about half of UK energy consumption. The need to manage this has been given new emphasis by the introduction of the Climate Change Levy. Energy Management in Buildings introduces students and energy managers to the principles of managing and conserving energy consumption in buildings people use for work or leisure. Energy consumption is considered for the provision of space heating, hot water, supply ventilation and air conditioning. The author introduces the use of standard performance indicators and energy consumption yardsticks and discusses the use and application of degree days. This second edition includes two new chapters on current regulations and environmental impact of building services. It closely follows recent bench marking published by CIBSE and the Defra energy efficiency Best Practice Programme and covers unit 18 in the new HND in building services engineering.

The international version includes all material covered in the standard edition, but numerical data and calculations are expressed in Système International (SI) units. Bringing to the forefront the most critical areas of effective energy cost cutting, this fully revised edition of this best-selling energy manager's guide provides the very latest strategies for improving lighting, combustion processes, steam generation/distribution, and industrial waste re-utilization. This book examines the core objectives of effective energy management, and clearly illustrates the techniques and tools proven most effective in achieving results. This book describes energy management outsourcing as a way of addressing the current energy challenges facing all organizations, namely high and volatile energy prices, the need to mitigate climate change and potential supply constraints as oil production peaks. These problems are likely to intensify in the coming years, yet most organizations have reduced in-house capability to address them, thus outsourcing is increasingly seen as an essential part of any strategy to reduce energy use and carbon emissions. The author describes the basic processes of energy management and how to outsource them in a strategic way to achieve maximum results. The process is based on a new model of energy management looking at total costs, which is presented in the book. The book offers a comprehensive guide to outsourcing energy management, discussing the risks and benefits and taking managers through the process of deciding whether to outsource or not, and finding and assessing an outsourcing partner. Managers looking to reduce energy consumption and carbon emissions through the use of external service providers will find Outsourcing Energy Management an ideal 'how to do it' guide.

Providing wastewater and drinking water service to citizens requires energy—and a lot of it. The twin problems of steadily rising energy costs and climate change have therefore made the issue of energy management one of the most salient issues facing wastewater and water utilities today. Energy management is also at the heart of efforts across the entire sector to ensure that utility operations are sustainable in the future. More and more utilities are realizing that a systematic approach for managing the full range of energy challenges they face is the best way to ensure that these issues are addressed on an ongoing basis in order to reduce climate impacts, save money, and remain sustainable. Working closely with a number of utilities and others, the Office of Water at the U.S. Environmental Protection Agency (EPA) is proactively addressing this issue by developing this Energy Management Guidebook for Wastewater and Water Utilities that provides a systematic approach to reducing energy consumption and energy cost. This Guidebook was specifically written to provide water and wastewater utility managers with a step-by-step method, based on a Plan-Do-Check-Act management system approach, to identify, implement, measure, and improve energy efficiency and renewable opportunities at their utilities.

This timely volume brings together case studies that address the urgent need to manage energy use and improve thermal comfort in modern buildings while preserving their historic significance and character. This collection of ten case studies addresses the issues surrounding the improvement of energy consumption and thermal comfort in modern buildings built between 1928 and 1969 and offers valuable lessons for other structures facing similar issues. These buildings, international in scope and diverse in type, style, and size, range from the Shulman House, a small residence in Los Angeles, to the TD Bank Tower, a skyscraper complex in Toronto, and from the Calouste Gulbenkian Foundation, a cultural venue in Lisbon, to the Van Nelle Factory in Rotterdam, now an office building. Showing ingenuity and sensitivity, the case studies consider improvements to such systems as heating, cooling, lighting, ventilation, and controls. They provide examples that demonstrate best practices in conservation and show ways to reduce carbon footprints, minimize impacts to historic materials and features, and introduce renewable energy sources, in compliance with energy codes and green-building rating systems. The Conserving Modern Heritage series, launched in 2019, is written by architects, engineers, conservators, scholars, and allied professionals. The books in this series provide well-vetted case studies that address the challenges of conserving twentieth-century heritage.

The business benefits of lower energy consumption are clear: lower energy costs, energy tax avoidance, selling excess CO2 credits, immediately adding savings to the bottom line and improved competitiveness. However, with a need to focus on day to day business management activities, implementing energy reduction programmes stretches the capabilities and know-how of responsible managers. Kit Oung's Energy Management in Business is an expert's guide to energy reduction. It covers four important aspects of managing energy: strategy for successful implementation, available tools and techniques, generating sustainable quick wins and active management involvement. This book offers distilled practical concepts with real life case studies chosen to build insight, and illustrate how managers and engineers can relate to a broad range of energy reduction opportunities. We take energy for granted, like the air we breathe. We need to engage employees with energy management in two ways. In a more general sense, for those using energy for normal working practices, awareness and behaviour change are key. For those with more direct influence over energy using systems, engagement is also fundamental. Energy Management in Business places the process firmly in the context of commercial and industrial business practice. The book is an excellent companion for any organisation seeking ISO 50001 certification and a reduced energy consumption, as well as those that simply wish to better understand the options, strategies and risks that every business now faces.

Energy is the mainstay of industrial societies, and without an adequate supply of energy the social, political and economic stability of nations is put into jeopardy. With supplies of inexpensive fossil fuels decreasing, and climate change factors becoming more threatening, the need to conserve energy and move steadily to more sustainable energy sources is more urgent than ever before. The updated Second Edition of this successful handbook includes chapters from leading experts on the economics and fiscal management of energy, with a focus on the tools available to advance efficiency and conservation measures. Updated coverage of renewable energy sources, energy storage technologies, energy audits for buildings and building systems, and demand-side management is provided. The appendix of the handbook provides extensive data resources for analysis and calculation.
