This book is a compilation of high-yield, at-a-glance summaries for various topics on which pathologists frequently need information in a quick reference format while at the microscope (or when cramming for the boards). The authors are early-career pathologists who have compiled this book from the perspective of pathologists-in-training. The focus is not organ-based histologic criteria, but rather everything else that goes into pathologic diagnoses but is difficult to keep committed to memory. The emphasis is on immunohistochemistry, special stains, grading systems, molecular markers, tumor syndromes, and helpful clinical references. The book has a unique format in that the information is presented primarily in tables and diagrams accompanied by minimal explanatory text. It is intended to serve as a 'peripheral brain' for pathology residents and also practicing pathologists, where frequently needed information is readily accessible and easy to navigate.

A strong grounding in basic histology is essential for all pathologists. However, there had always been a gap between histology and pathology in which histologic information specifically for the pathologist was often lacking. Histology for Pathologists deals with the microscopic features of normal human tissues, from the perspective of the surgical pathologist. This is the only text that uses human (vs. animal) tissues for the histology. It is the best reference in the literature for information on normal histology, and, as such, is essential for all clinical pathologists. Written by pathologists for pathologists, the new edition updates the pathologist's understanding of normal histology up to date with the incremental advances made in the last five years. The 3rd edition has become a "classic" purchased by virtually all residents beginning their pathology training, as well as pathologists in practice. The 4th edition builds on that substantial foundation. The table of contents remains essentially the same with the exception of some changes in authorship.

"Diagnostic Pathology: Soft Tissue Tumors, Second Edition strives to reflect the incredible amount of new information that has been uncovered in the field of soft tissue pathology over the last half decade, including changes in terminology and classification (per the latest 2013 World Health Organization Consensus Classification). The new edition includes new chapters and sections that detail both recently described true soft tissue entities/variants as well as mesenchymal tumors that occur outside of standard somatic soft tissue locations (e.g., viscera, gastrointestinal tract), and even those nonmesenchymal tumors and proliferations that often find themselves in the differential considerations of true soft tissue tumors. Additionally, chapters that discuss immunohistochemistry and molecular genetics as they pertain to soft tissue pathology have been remodeled to reflect the stunning proliferation of new antibodies and molecular signatures that seems to expand exponentially month by month. Perhaps most notably, the vast majority of histologic images herein are completely new and unique to the second edition. In addition, the photogalleries in a large number of existing chapters have been expanded to include both salient microscopic features as well as less common and even rare variant morphologies in an effort to more thoroughly photodocument the rich morphologic spectrum of soft tissue pathology."--Provided by publisher.

Fetal and Neonatal Pathology presents in one volume an account of the pathological findings encountered when examining fetuses from the second and third trimester of pregnancy as well as in neonatal death. It provides essential clinical and physiological information and discusses the pathogenesis of pathological findings as a guide to the formulation of the appropriate method of investigation. The book is divided into two parts. The first deals with examination of the products of conception after termination of pregnancy for fetal anomaly. The range of pathological abnormality is described and its relevance discussed. Attention is drawn to the differences in pathological findings in specific conditions between the second and third trimester. The second part of the book is system orientated and describes and illustrates those pathological problems which are likely to be encountered in the fetus and neonate. Each chapter is introduced by a concise account of the development of that system. Where relevant there is also discussion of changes at birth as well as changes in normal function that may occur during the neonatal period. Fetal and Neonatal Pathology is primarily written for the morbid anatomist and histopathologist. It also provides a valuable source of reference for obstetricians, neonatologists and paediatricians. Its value as a working tool of reference is enhanced by effective cross-referencing between sections by both chapter and page number. 1

Histopathological assessment of tissue sections is an important component of many preclinical studies which are conducted to support the safety and clinical development of novel therapeutic agents for use in the treatment of human diseases. The drug discovery process, aided by modern biotechnology, is now capable of generating highly potent, pharmacologically active agents which can give rise to quite unusual constellations of tissue pathology. The complexity and the number of histopathological findings in individual studies indicate the need for lucidity in descriptions and conclusions. In the light of these and other difficulties, this text is aimed towards bringing together into one volume a description of histopathological changes which relate to toxicity testing of therapeutic agents in the usual test species: rat, mouse, dog and non-human primate. This book is an excellent starting point for the analysis of drug-induced findings in toxicity studies.
