Forensic Psychological Assessment in Immigration Court is an essential specialized guide for psychologists and clinicians who work with immigrants. Immigration evaluations differ in many ways from other types of forensic assessments because of the psycholegal issues that extend beyond the individual, including family dynamics, social context, and cross-cultural concerns. Immigrants are often victims of trauma and require specialized expertise to elicit the information needed for assessment. Having spent much of their professional careers as practicing forensic psychologists, authors Evans and Hass have compiled a comprehensive text that draws on forensic psychology, psychological assessment, traumatology, family processes, and national and international political forces to present an approach for the effective and ethical practice of forensic psychological assessment in Immigration Court.

"This book attempts to bridge these bodies of scientific literature and practice by demonstrating the central role of personality and personality disorders in the assessment of patients within the context of court-related issues and problems. It illustrates how personality-guided assessment adds to what the psychometricians might call "incremental validity," what the social psychologists might call "ecological validity," and what triers of fact (judges and juries) might call "the truth." The material in this book concentrates on the assessment of adults. However, in a few sections, material related to the assessment of juvenile offenders is included, especially the assessment of psychopathy and violence risk assessments"--Pref. The field of forensic psychology explores the intersection of psychology and the law. The purpose of this book is to examine topics in the field using the powerful, multidisciplinary, conceptually integrated approach that the natural sciences have embraced for decades with great success. Darwin's theory of evolution by natural selection is the meta-theoretical framework that unifies the field of biology. It unites research and understanding of the development, control, and organization of behavior. The study of humans, which includes all of the social sciences, is part of the field of biology. Darwin's theory provides a powerful meta-theoretical framework that can unify and energize forensic psychology, just as it has the biological sciences. Evolutionary processes undoubtedly shaped physiological characteristics to help solve problems of survival and reproduction. The lungs, for example, with their vast surface area and moist membranes are marvelous adaptations for extracting oxygen and releasing carbon dioxide. Natural selection is the only known process capable of shaping complex functional mechanisms. Just as it shaped physiological adaptations with specific problem-solving functions, it also shaped our thoughts and emotions to guide behaviors toward solving recurrent problems of survival and reproduction. With this logic, we can use knowledge of ancestral problems to guide our understanding of how the mind works. Evolutionary Forensic Psychology is a necessary step toward a unified and complete understanding of psychology and the law. It recognizes that crimes such as murder, non-lethal violence, rape, and theft are manifestations of evolutionarily recurrent selection when they gave individuals an advantage in competition for resources. Each of the chapters that comprise this volume has been selected to provide the first unified examination of important research contributions and future directions of Evolutionary Forensic Psychology.
