Blending contemporary and traditional perspectives, this groundbreaking work offers guidance on the profound foundational practices of the Great Perfection. It contains classic commentaries by the renowned Tibetan masters Jigme Lingpa and Jamyang Khyentse Wangpo, alongside a lively contemporary discussion by filmmaker, author, and spiritual teacher Dzongsar Jamyang Khyentse that discusses how to incorporate these ancient practices into the fast-paced lifestyle of the Western world. Also included are a lengthy introduction to the world of Tibetan Buddhism and its meditative practices, as well as the long and short preliminary practice liturgies and numerous appendices on the nine yanas and other topics. The ngöndro or preliminary practice is treasured in the Ancient School of Tibetan Buddhism as vital for effecting a profound inner transformation and as a foundation for the very highest teachings of the Great Perfection, or Dzogchen. In particular, the Longchen Nyingtik ngöndro—revealed by the great saint Jigme Lingpa following a series of visions in which he was blessed by the omniscient Longchen Rabjam and received the transmission of his wisdom mind—has long been cherished by followers of all traditions on account of its power, depth, and poetic beauty.

Some people call it learning how to drive stick or how to drive a manual. Whatever you call it, both are the same. Many drivers never learn how to drive a car with a manual transmission, or stick shift. The ability to drive a stick shift will allow you to drive any type of vehicle regardless of it is automatic or manual. You've heard that a driving stick gives you more control of your car in every situation, from a passing maneuver to descending a snowy hill. You've heard driving a stick shift car is more economical at the gas pump. You've heard it's more fun. But you've also heard it's hard to learn. There are gearshifts to master, your engine can stall, your car can roll backward on a hill, and understanding the clutch is a nightmare. So, what if I told you using a clutch is no more difficult than using a faucet, or that your car's handbrake is a lot more than just a 'parking brake', or that I can teach you - in one sentence - how to avoid ever stalling your engine? I've already taught thousands of people how to drive stick - men and women of all ages - normal people, not engineering students or race car engineers. And I can teach you.

As licensed drivers they will have the skills that make driving pleasurable as well as safe.

Every year, 1.2 million people die in automobile accidents and up to 50 million are injured. Many of these deaths are due to driver error and other preventable causes. Autonomous or highly aware cars have the potential to positively impact tens of millions of people. Building an autonomous car is not easy. Although the absolute number of traffic fatalities is tragically large, the failure rate of human driving is actually very small. A human driver makes a fatal mistake once in about 88 million miles. As a co-founding member of the Stanford Racing Team, we have built several relevant prototypes of autonomous cars. These include Stanley, the winner of the 2005 DARPA Grand Challenge and Junior, the car that took second place in the 2007 Urban Challenge. These prototypes demonstrate that autonomous vehicles can be successful in challenging environments. Nevertheless, reliable, cost-effective perception under uncertainty is a major challenge to the deployment of robotic cars in practice. This dissertation presents selected perception technologies for autonomous driving in the context of Stanford's autonomous cars. We consider speed selection in response to terrain conditions, smooth road finding, improved visual feature optimization, and cost effective car detection. Our work does not rely on manual engineering or even supervised machine learning. Rather, the car learns on its own, training itself without

human teaching or labeling. We show this "self-supervised" learning often meets or exceeds traditional methods. Furthermore, we feel self-supervised learning is the only approach with the potential to provide the very low failure rates necessary to improve on human driving performance.

The author offers a practical manual on learning to drive and attempts to allay the fear that it inspires in most people. There are suggestions for improving driving technique and overcoming nerves as well as incredible anecdotes gathered over Pritchard's career as a driving instructor.

This book arises from the author's experience of the South African science curriculum development and teaching since 1994, exploring definitions of science and approaches to science education appropriate to a newly liberated developing country. Each of the 50 chapters is borne out of Cliff Malcolm's close relationships with communities in SA where he obtained deep insights into their attitudes to science teaching and learning, providing him with an empirical basis to challenge tertiary institutions to transform their curriculum offerings to embrace the culture and world views of African students.

A vital resource for pilots, instructors, and students, from the most trusted source of aeronautic information.

Robots are being used in increasingly complicated and demanding tasks, often in environments that are complex or even hostile. Underwater, space and volcano exploration are just some of the activities that robots are taking part in, mainly because the environments that are being explored are dangerous for humans. Robots can also inhabit dynamic environments, for example to operate among humans, not just in factories, but also taking on more active roles. Recently, for instance, they have made their way into the home entertainment market. Given the variety of situations that robots will be placed in, learning becomes increasingly important. Robot learning is essentially about equipping robots with the capacity to improve their behaviour over time, based on their incoming experiences. The papers in this volume present a variety of techniques. Each paper provides a mini-introduction to a subfield of robot learning. Some also give a fine introduction to the field of robot learning as a whole. There is one unifying aspect to the work reported in the book, namely its interdisciplinary nature, especially in the combination of robotics, computer science and biology. This approach has two important benefits: first, the study of learning in biological systems can provide robot learning scientists and engineers with valuable insights into learning mechanisms of proven functionality and versatility; second, computational models of learning in biological systems, and their implementation in simulated agents and robots, can provide researchers of biological systems with a powerful platform for the development and testing of learning theories.
