The National Household Education Survey (NHES) is a random digit dial telephone survey of households developed by the National Center for Education Statistics. It has been conducted in 1991, 1993, 1995, and 1996, with varying components each year. The NHES 91/93/95/96 CD-ROM contains an electronic codebook (ECB) program that, after being installed on a personal computer, allows the user to examine the variables in each of the NHES data sets as well as create Statistical Analysis System (SAS) or Statistical Package for the Social Sciences (SPSS) programs to generate an extract data file for any of the NHES data files on the CD-ROM. The files include the 1991 and 1995 Adult Education files, the primary and preprimary education files from 1991, the school readiness and school safety files from 1993, the 1995 early childhood program participation file, and the 1996 household and library, parent and family involvement in education and civic involvement, youth civic involvement, and adult civic involvement files. The ECB is a DOS-based program for IBM-compatible personal computers. Sections describe its contents and use, focusing on what can be done with the ECB and how to do it. Emphasis is on extracting information from the files. Eight appendixes provide specific use information and samples, including SAS and SPSS samples. (SLD)

An introduction to a broad range of topics in deep learning, covering mathematical and conceptual background, deep learning techniques used in industry, and research perspectives. "Written by three experts in the field, Deep Learning is the only comprehensive book on the subject." —Elon Musk, cochair of OpenAI; cofounder and CEO of Tesla and SpaceX Deep learning is a form of machine learning that enables computers to learn from experience and understand the world in terms of a hierarchy of concepts. Because the computer gathers knowledge from experience, there is no need for a human computer operator to formally specify all the knowledge that the computer needs. The hierarchy of concepts allows the computer to learn complicated concepts by building them out of simpler ones; a graph of these hierarchies would be many layers deep. This book introduces a broad range of topics in deep learning. The text offers mathematical and conceptual background, covering relevant concepts in linear algebra, probability theory and information theory, numerical computation, and machine learning. It describes deep learning techniques used by practitioners in industry, including deep feedforward networks, regularization, optimization algorithms, convolutional networks, sequence modeling, and practical methodology; and it surveys such applications as natural language processing, speech recognition, computer vision, online recommendation systems, bioinformatics, and videogames. Finally, the book offers research perspectives, covering such theoretical topics as linear factor models,

autoencoders, representation learning, structured probabilistic models, Monte Carlo methods, the partition function, approximate inference, and deep generative models. Deep Learning can be used by undergraduate or graduate students planning careers in either industry or research, and by software engineers who want to begin using deep learning in their products or platforms. A website offers supplementary material for both readers and instructors.

What if I tell you that it is possible to make your food, in your kitchen, without paying the chef across the street a dime for it? Will you believe me? Oh, the best part, you don't have to know how to cook to make your food! Will you also believe me if I also tell you that you can produce the broken piece of your board game and other broken things in your home or office without paying for them? Ahhh, who am I that you should believe? You don't have to believe me, but you can google about these and see how 3D printing is changing the world. Maybe you think you need about \$1000 or need to know about engineering design to get started. Well, I tell you, you might be wrong. You don't need to have your 3D printer; neither do you need to have any engineering design knowledge to enjoy the benefits of 3D printing. All you need is to buy this book and find out how to go about that. If, however, you've got yourself an excellent 3D printer or you want to buy a friendly cheap 3D printer to fully benefit from this trend of additive manufacturing, this guide is also for you. This guide is going to teach you about 3D printing: -What it is -The history of 3D printing -How it works -How it is better than traditional manufacturing -The different technological processes of 3D printing -Why you need a 3D printer -How to choose a machine (If you haven't got one) -3D printing software tools and build materials -Benefits and applications of 3D printing -Slicer settings to ensure smooth printing, and -How to maintain your machine. You can't get it all in one place like it is done in this book. Order for a copy, read, practice and don't be left behind by technology. P.S.: All you have to do to make your own food is a 3D digital design of the food, a food material - flour maybe - and a good 3D printer. When you buy this book you get the full gist on how to make that happen.
