Music libraries often contain much more than books, scores, and recordings; they are also home to a wealth of archival music materials. Despite having archival holdings, many music librarians struggle to provide adequate storage, description, and access to these materials. Remaining cognizant of the wide variety of funding and staffing available to music libraries across North America, this basic manual provides an entry point into the archival profession for music librarians without formal archival training. At the same time the manual also serves as a ready-reference book for those already familiar with basic archival practices. This manual discusses archival theory alongside archival principles and practices, explaining key concepts and developments in acquisition, appraisal, arrangement, description, preservation, digitization, and funding. These fundamentals are demonstrated throughout the manual by numerous examples and hypothetical situations a music librarian is likely to encounter while managing archival music collections.

This book provides a comprehensive analysis of the remedies practice the European Commission has adopted on the basis of articles 7 and 9 of regulation 1/03. Using article 7 as a normative benchmark, it shows that most of the criticism levelled at the Commission's article 9 decisions and the Alrosa judgment of the CJEU is not justified, since critics tend to over-state both the rigour of article 7 and the laxness of article 9. Remaining inconsistencies between the commitment practice and the standards for infringement decisions can, it is submitted, be justified by the consensual nature of commitment decisions and

their underlying goal of procedural economy. Moreover, it is suggested that too little importance is generally assigned to the beneficial effect which commitments bring about by providing for precise and enforceable obligations without sacrificing the concerned undertakings' freedom to choose how to put the infringement to an end. Adopting a case-oriented approach, this study provides valuable insights for academics and practitioners alike.

Automobiles are responsible for a substantial part of the world's consumption of primary energy, mostly fossil liquid hydrocarbons. The reduction of the fuel consumption of these vehicles has become a top priority. Many ideas to reach that objective have been presented. In most cases these systems are more complex than the traditional approaches. For such complex systems a heuristic design approach fails. The only way to deal with this situation is to employ model-based methods. This text provides an introduction to the mathematical modeling and subsequent optimization of vehicle propulsion systems and their supervisory control algorithms.
