Collaborations of physicians and researchers with industry can provide valuable benefits to society, particularly in the translation of basic scientific discoveries to new therapies and products. Recent reports and news stories have, however, documented disturbing examples of relationships and practices that put at risk the integrity of medical research, the objectivity of professional education, the quality of patient care, the soundness of clinical practice guidelines, and the public's trust in medicine. Conflict of Interest in Medical Research, Education, and Practice provides a comprehensive look at conflict of interest in medicine. It offers principles to inform the design of policies to identify, limit, and manage conflicts of interest without damaging constructive collaboration with industry. It calls for both short-term actions and long-term commitments by institutions and individuals, including leaders of academic medical centers, professional societies, patient advocacy groups, government agencies, and drug, device, and pharmaceutical companies. Failure of the medical community to take convincing action on conflicts of interest invites additional legislative or regulatory measures that may be overly broad or unduly burdensome. Conflict of Interest in Medical Research, Education, and Practice makes several recommendations for strengthening conflict of interest policies and curbing relationships that create risks with little benefit. The book will serve as an invaluable resource for individuals and organizations committed to high ethical standards in all realms of medicine.

Through an interdisciplinary analysis of the rulings of the Court of Justice of the European Union, this book offers 'thick' descriptions, contextual histories and critical narratives engaging with leading or minor personalities involved behind the scenes of each case. The contributions depart from the notion that EU law and its history should be narrated in a linear and incremental way to show instead that law evolves in a contingent and not determinate manner. The book shows that the effects of judge-made law remain relatively indeterminate and each case can be retold through different contextual narratives, and shows the commitment of the European legal elites to the experience of legal reasoning. The idea to cluster the stories around prominent cases is not to be fully comprehensive, but to re-focus the scholarship and teaching of EU law by moving beyond the black letter and unravel the lawyering techniques to achieve policy results.

U.S. Navy personnel who work on submarines are in an enclosed and isolated environment for days or weeks at a time when at sea. To protect workers from potential adverse health effects due to those conditions, the U.S. Navy has established exposure guidance levels for a number of contaminants. In this latest report in a series, the Navy asked the National Research Council (NRC) to review, and develop when necessary, exposure guidance levels for 11 contaminants. The report recommends exposure levels for hydrogen that are lower than current Navy guidelines. For all other contaminants (except for two for which there are insufficient data), recommended levels are similar to or slightly higher than those proposed by the Navy. The report finds that, overall, there is very little exposure data available on the submarine environment and echoes recommendations from earlier NRC reports to expand exposure monitoring in submarines.

The discovery of Bose–Einstein condensation (BEC) in trapped ultracold atomic gases in 1995 has led to an explosion of theoretical and experimental research on the properties of Bose-condensed dilute gases. The first treatment of BEC at finite temperatures, this book presents a thorough account of the theory of two-component dynamics and nonequilibrium behaviour in superfluid Bose gases. It uses a simplified microscopic model to give a clear, explicit account of collective modes in both the collisionless and collision-dominated regions. Major topics such as kinetic equations, local equilibrium and two-fluid hydrodynamics are introduced at an elementary level. Explicit predictions are worked out and linked to experiments. Providing a platform for future experimental and theoretical studies on the finite temperature dynamics of trapped Bose gases, this book is ideal for researchers and graduate students in ultracold atom physics, atomic, molecular and optical physics and condensed matter physics.

The field of occupational health and safety constantly changes, especially as it pertains to biomedical research. New infectious hazards are of particular importance at nonhuman-primate facilities. For example, the discovery that B virus can be transmitted via a splash on a mucous membrane raises new concerns that must be addressed, as does the discovery of the Reston strain of Ebola virus in import quarantine facilities in the U.S. The risk of such infectious hazards is best managed through a flexible and comprehensive Occupational Health and Safety Program (OHSP) that can identify and mitigate potential hazards. Occupational Health and Safety in the Care and Use of Nonhuman Primates is intended as a reference for vivarium managers, veterinarians, researchers, safety professionals, and others who are involved in developing or implementing an OHSP that deals with nonhuman primates. The book lists the important features of an OHSP and provides the tools necessary for informed decision-making in developing an optimal program that meets all particular institutional needs.

A magnificent new collection of stories by “the contemporary Hungarian master of apocalypse” (Susan Sontag) In *The World Goes On*, a narrator first speaks directly, then tells eleven unforgettable stories, and then bids farewell (“for here I would leave this earth and these stars, because I would take nothing with me”). As László Krasznahoraki himself explains: “Each text is about drawing our attention away from this world, speeding our body toward annihilation, and immersing ourselves in a current of thought or a narrative...” A Hungarian interpreter obsessed with waterfalls, at the edge of the abyss in his own mind, wanders the chaotic streets of Shanghai. A traveler, reeling from the sights and sounds of Varanasi, encounters a giant of a man on the banks of the Ganges ranting on the nature of a single drop of water. A child laborer in a Portuguese marble quarry wanders off from work one day into a surreal realm utterly alien from his daily toils. *The World Goes On* is another amazing masterpiece by the winner of the 2015 Man Booker International Prize. “The excitement of his writing,” Adam Thirwell proclaimed in the *New York Review of Books*, “is that he has come up with this own original forms—there is nothing else like it in contemporary literature.”

Offers information on topics including gene therapy, the warning signs of cancer, and biological warfare, and provides the generic and trade names of drugs with discussion of their effects.
