A comprehensive introduction to contract theory, emphasizing common themes and methodologies as well as applications in key areas. Despite the vast research literature on topics relating to contract theory, only a few of the field's core ideas are covered in microeconomics textbooks. This long-awaited book fills the need for a comprehensive textbook on contract theory suitable for use at the graduate and advanced undergraduate levels. It covers the areas of agency theory, information economics, and organization theory, highlighting common themes and methodologies and presenting the main ideas in an accessible way. It also presents many applications in all areas of economics, especially labor economics, industrial organization, and corporate finance. The book emphasizes applications rather than general theorems while providing self-contained, intuitive treatment of the simple models analyzed. In this way, it can also serve as a reference for researchers interested in building contract-theoretic models in applied contexts. The book covers all the major topics in contract theory taught in most graduate courses. It begins by discussing such basic ideas in incentive and information theory as screening, signaling, and moral hazard. Subsequent sections treat multilateral contracting with private information or hidden actions, covering auction theory, bilateral trade under private information, and the theory of the internal organization of firms; long-term contracts with private information or hidden actions; and incomplete contracts, the theory of ownership and control, and contracting with externalities. Each chapter ends with a guide to the relevant literature. Exercises appear in a separate chapter at the end of the book.

For courses in Principles of Microeconomics Acemoglu, Laibson, List: An evidence-based approach to economics Throughout Microeconomics, authors Daron Acemoglu, David Laibson, and John List use real economic questions and data to help students learn about the world around them. Taking a fresh approach, the authors use the themes of optimization, equilibrium and empiricism to illustrate the power of simple economic ideas, and their ability to explain, predict, and improve what happens in the world. Each chapter begins with an empirical question that is later answered using data in the Evidence-Based Economics feature. As a result of the text's practical emphasis, students will learn to apply economic principles to guide the decisions they make in their own lives. Governments use them to sell everything from oilfields to pollution permits, and to privatize companies; consumers rely on them to buy baseball tickets and hotel rooms, and economic theorists employ them to explain booms and busts. Auctions make up many of the world's most important markets; and this book describes how auction theory has also become an invaluable tool for understanding economics. Auctions: Theory and Practice provides a non-technical introduction to auction theory, and emphasises its practical application. Although there are many extremely successful auction markets, there have also been some notable fiascos, and Klemperer provides many examples. He discusses the successes and failures of the one-hundred-billion dollar "third-generation" mobile-phone license auctions; he, jointly with Ken Binmore, designed the first of these. Klemperer also demonstrates the surprising power of auction theory to explain seemingly unconnected issues such as the intensity of different forms of industrial competition, the costs of litigation, and even stock trading 'frenzies' and financial crashes. Engagingly written, the book makes the subject exciting not only to economics students but to anyone interested in auctions and their role in economics.

This book provides a comprehensive introduction to modern auction theory and its important new applications. It is written by a leading economic theorist whose suggestions guided the creation of the new spectrum auction designs. Aimed at graduate students and professionals in economics, the book gives the most up-to-date treatments of both traditional theories of 'optimal auctions' and newer theories of multi-unit auctions and package auctions, and shows by example how these theories are used. The analysis explores the limitations of prominent older designs, such as the Vickrey auction design, and evaluates the practical responses to those limitations. It explores the tension between the traditional theory of auctions with a fixed set of bidders, in which the seller seeks to squeeze as much revenue as possible from the fixed set, and the theory of auctions with endogenous entry, in which bidder profits must be respected to encourage participation.

Built from the ground up to focus on what matters to students in today's high-tech, globalized world, Dean Karlan and Jonathan Morduch's *Macroeconomics* represents a new generation of products, optimized for digital delivery and available with the best-in-class adaptive study resources in McGraw-Hill's LearnSmart Advantage Suite. Engagement with real-world problems is built into the very fabric of the learning materials as students are encouraged to think about economics in efficient, innovative, and meaningful ways. Drawing on the authors' experiences as academic economists, teachers, and policy advisors, a familiar curriculum is combined with material from new research and applied areas such as finance, behavioral economics and the political economy, to share with students how what they're learning really matters. This modern approach is organized around learning objectives and matched with sound assessment tools aimed at enhancing students' analytical and critical thinking competencies. Students and faculty will find content that breaks down barriers between what goes on in the classroom and what is going on in our nation and broader world. By teaching the right questions to ask, Karlan and Morduch provide readers with a method for working through decisions they'll face in life and ultimately show that economics is the common thread that enables us to understand, analyze, and solve problems in our local communities and around the world.

This text emphasizes a modern approach to microeconomics by integrating new topics in microeconomic theory and making them accessible to students. These topics include risk and uncertainty, asymmetric information and game theory. Traditional topics are also treated in a clear way with solid applications. Modifications have been made to the text in this edition, these include new information on the theory of the firm, specifically the coverage of cost, and examples are included throughout the text to reinforce the material presented.

A synthesis of theoretical and practical research on combinatorial auctions from the perspectives of economics, operations research, and computer science.

This book asks a simple question: are the tech giants monopolies? In the current environment of suspicion towards the major technology companies as a result of concerns about their power and influence, it has become commonplace to talk of Google, Facebook, Amazon, Apple, Microsoft, or Netflix as the modern day version of the 19th century trusts. In turn, the tech giants are vilified for a whole range of monopoly harms towards consumers, workers and even the democratic process. In the US and the EU, antitrust, and regulatory reform is on the way. Using economics, business and management science as well legal reasoning, this book offers a new perspective on big tech. It builds a theory of "mologopoly". The theory advances that the tech giants, or at least some of them, coexist both as monopolies and oligopoly firms that compete against each other in an environment of substantial uncertainty and economic dynamism. With this, the book assesses ongoing antitrust and regulatory policy efforts. It demonstrates that it is counterproductive to pursue policies that introduce more rivalry in mologopoly markets subject to technological discontinuities. And that non-economic harms like privacy violations, fake news, or hate speech are difficult issues that belong to the realm of regulation, not antimonopoly remediation.
