As telecommunications products and services have become an essential part of everyday life, consumers have at the same time grown intimately familiar with the concept of tiered pricing that is associated with such services. With tiered service structures, users may select from a

small set of tiers that offer progressively higher levels of service with a corresponding increase in price. Tiered structures have been applied in several forms to wireless services (e. g. , characterized by the amount of voice minutes, number of text messages, or the size of one's circle of friends to whom voice calls are free), Internet broadband access (e. g. , the access speed or volume of monthly transferred data), and digital TV offerings (e. g. , the number of channels included), among others. Service tiering is a form of market segmentation which, if applied appropriately, benefits both providers and consumers by making available services and associated price points that reflect the diversity in consumers' needs and ability to pay. The purpose of this book is to develop a theoretical framework for reasoning about and pricing Internet tiered services, as well as a practical algorithmic toolset for network providers to develop customized menus of service offerings. We provide a comprehensive study of the design, sizing, and pricing of tiered structures for Internet services, and we illustrate their potential in simplifying the operation of complex components such as packet schedulers.
