Christian Raack received his diploma (master's) degree in mathematics from the Technical University Berlin in 2006 and later his Ph.D. in 2012. As a full-time researcher at the Zuse Institute Berlin he has been involved in a large variety of projects mainly stemming from optimization problems in the telecommunications sector. In this thesis, the author develops methods in mathematical optimization to dimension networks at minimal cost. The considered planning problems typically arise in the strategic design of telecommunication or public transport networks and also in logistics. Given hardware and cost models, the challenge is to provide network topologies and efficient capacity plans that meet the demand for network traffic (data, passengers, freight). The author tries to incorporate crucial aspects of practical interest, such as the discrete structure of available capacities as well as the uncertainty of demand forecasts. One of the essential aspects studied in this work is the use of cutting planes to enhance solution approaches based on multi-commodity flow formulations. Providing theoretical and computational evidence for the efficacy of inequalities based on network cuts, existing theory and algorithmic work is extended in different directions.

Magic, cunning, and one very special cat join forces in this hilarious, extraordinary tale by the author of the Dairy Queen trilogy and Princess Ben. Princess Wisdom, known as Dizzy, longs for a life of adventure beyond the staid old kingdom of Montagne. Tips, a soldier, longs to keep his true identity a secret. Fortitude, an orphaned maid, longs only for Tips. These three souls might possibly attain their dreams while preserving their empire from ruin — if only they can bear one another's company long enough to come up with a plan.

Today's headlines report cities going bankrupt, states running large deficits, and nations stuck in high debt and stagnation. Philip Kotler, Donald Haider, and Irving Rein argue that thousands of "places" -- cities, states, and nations -- are in crisis, and can no longer rely on national industrial policies, such as federal matching funds, as a promise of jobs and protection. When trouble strikes, places resort to various palliatives such as chasing grants from state or federal sources, bidding for smokestack industries, or building convention centers and exotic attractions. The authors show instead that places must, like any market-driven business, become attractive "products" by improving their industrial base and communicating their special qualities more effectively to their target markets. From studies of cities and nations throughout the world, Kotler, Haider, and Rein offer a systematic analysis of why so many places have fallen on hard times, and make recommendations on what can be done to revitalize a place's economy. They show how "place wars" -- battles for Japanese factories, government projects, Olympic Games, baseball team franchises, convention business, and other economic prizes -- are often misguided and end in wasted money and effort. The hidden key to vigorous economic development, the authors argue, is strategic marketing of places by rebuilding infrastructure, creating a skilled labor force, stimulating local business entrepreneurship and expansion, developing strong public/private partnerships, identifying and attracting "place compatible" companies and industries, creating distinctive local attractions, building a service-friendly culture, and promoting these advantages effectively. Strategic marketing of places requires a deep understanding of how "place buyers" -- tourists, new residents, factories, corporate headquarters, investors -- make their place decisions. With this understanding, "place sellers" -- economic development agencies, tourist promotion agencies, mayor's offices -- can take the necessary steps to compete aggressively for place buyers. This straightforward guide for effectively marketing places will be the framework for economic development in the 1990s and beyond.

Industrial clusters in Silicon Valley, Hsinchu Park, and northern Italy, and in the vicinity of Cambridge, U.K., have captured the imagination of policymakers, researchers, city planners and business people. Where clusters take root, they can generate valuable spillovers, promote innovation, and create the critical industrial mass for sustained growth. For cities such as Kitakyushu, Japan, that are faced with the erosion of their traditional industrial base and are threatened by economic decline, creating a cluster that would reverse the downward trends is enormously attractive. Growing Industrial Clusters in Asia offers practical guidance on the nature of clusters and the likely efficacy of measures that could help build a cluster. It draws on the experience of both established dynamic clusters and newly emerging ones that show considerable promise. The insights that result from its anlaysis will be of particular interest to policy makers, urban planners, business people, and researchers.

Shows how political leaders can identify economic opportunities and help their economies compete successfully in the global marketplace Renowned economist and author of Big Business Tyler Cowen brings a groundbreaking analysis of capitalism, the job market, and the growing gap between the one percent and minimum wage workers in this follow-up to the New York Times bestseller The Great Stagnation. The United States continues to mint more millionaires and billionaires than any country ever. Yet, since the great recession, three quarters of the jobs created here pay only marginally more than minimum wage. Why is there growth only at the top and the bottom? Economist and bestselling author Tyler Cowen explains that high earners are taking ever more advantage of machine intelligence and achieving ever-better results. Meanwhile, nearly every business sector relies less and less on manual labor, and that means a steady, secure life somewhere in the middle—average—is over. In Average is Over, Cowen lays out how the new economy works and identifies what workers and entrepreneurs young and old must do to thrive in this radically new economic landscape.

Since 1958 the Maritime Administration has continuously conducted instructions in use of collision avoidance radar for qualified U.S. seafaring personnel and representatives of interested Federal and State Agencies.Beginning in 1963, to facilitate the expansion of training capabilities and at the same time to provide the most modern techniques in training methods, radar simulators were installed in Maritime Administration?s three region schools.It soon became apparent that to properly instruct the trainees, even with the advanced equipment, a standardize up-to-date instruction manual was needed. The first manual was later revised to serve both as a classroom textbook and as an onboard reference handbook.This newly updated manual, the fourth revision, in keeping with Maritime Administration policy, has been restructured to include improved and more effective methods of plotting techniques for use in Ocean, Great Lakes, Coastwise and Inland Waters navigation.Robert J. In this volume, international experts critically review cutting-edge advances in neuroprogression research. The relevance of these findings to psychiatric and neurological disorders is clarified. Potential etiopathological mechanisms of neuroprogression are described in detail. Special emphasis is placed on the role of the immune system in stress and stress-related disorders and brain-immune interactions. The epigenetic consequences of adverse experiences in early childhood, which may prelude major psychiatric disorders, are also considered. Recent research has not only provided evidence of neuroprogression in psychiatric and neurological disorders, but has shown that pharmacologic interventions have the potential to arrest this process. Advances in testing and imaging will lead to timely diagnosis and earlier treatment. Identification of neurological mechanisms alongside (epi-)genetic vulnerability markers will create truly personalized treatment programs. This book is a valuable resource for everyone who wishes to gain insight into the essential features of the neuroprogressive course of major psychiatric and neurological disorders. In particular, psychiatrists, neuroscientists and neurologists ¬ as well as immunologists, pharmacologists and molecular biologists - will find very informative chapters of direct relevance to their field.

Kenneth Burke was arguably the most important rhetorician and critical theorist of the 20th Century. The Elements of Dramatism is the first pragmatic introduction to the work of Kenneth Burke for those interested in communication and language. This brief paperback focuses on the analytical methods Burke coined as dramatism, which has exerted an enormous influence for many years on people interested in the dynamics of human communication and symbol-use in many areas of study, particularly composition and speech communication. Each chapter includes discussions of key concepts in the context of dramatism and rhetoric, extended applications of these concepts to a variety of rhetorical problems and forms (including literature, photography, and film), and clear guidelines for applying these strategies. Longer applications and illustrations of key concepts are accompanied by readings that elaborate them or serve as sources of analysis. The book makes available some of Burke's most important and accessible discussions and applications of dramatism. For those interested in communication and language

We have telephony to talk to each other, messaging to dispatch mail or instant messages, browsing to read published content and search engines to locate content sites. However, current mobile networks do not provide the possibility for one application rich terminal to communicate with another in a peer-to-peer session beyond voice calls. Mobile telephony with the current technology has been hugely successful and shows that there is immense value in communicating with peers while being mobile, and with increasingly available smarter multimedia terminals the communication experience will be something more than just exchanging voice. Those multimedia terminals need IP multimedia networks. Hence, the Third Generation Partnership Project (3GPP) has developed a standard for SIP based IP multimedia service machinery known as 'The IMS (IP Multimedia Subsystem)' and this informative book explains everything you need to know about it......... Presents the architecture and functionality of logical elements of IMS and their interfaces providing detailed description of how elements are connected, what protocols are used and how they are used Explains how the optimisation and security of the mobile communication environment has been designed in the form of user authentication and authorisation based on mobile identities Illustrates how optimisation at the radio interface is achieved using specific rules at the user to network interface. This includes signalling compression mechanisms as well as security and policy control mechanisms, allowing radio loss and recovery detection Addresses important aspects from an operator's point of view while developing architecture such as charging framework, policy and service control Describes many services on top of IMS in detail, including voice, presence, messaging and conferencing. Written in a manner that allows readers to choose the level of knowledge and understanding they need to gain about the IMS, this volume will have instant appeal to a wide audience ranging from marketing managers, research and development engineers, network engineers, developers, test engineers to university students.

"'What is involved, when we say what people are doing and why they are doing it? An answer to that question is the subject of this book.'"--Mr. Burke, as quoted on the cover.

This book introduces OLAP with progressive lessons to help readers begin creating solutions quickly and is the only self-paced training
