After being kidnapped by Mr. Chu, Atticus "Tick" Higginbottom and his friends Paul and Sofia must survive a series of tests in several different Realities.

The primary focus of this text is to provide a bridge for students between the academic world and the real world. This bridge is built through an understanding of what is law, how law is created, how law affects almost every activity of human conduct, and how legal institutions operate. Intended mainly for architectural and engineering students, but increasingly for those in business schools and law schools, this text features a clear, concise, and jargon-free presentation. It probes beneath the surface of legal rules and uncovers why these rules developed as they did, outlines arguments for and against these rules, and examines how they work in practice. Updated with the most recent developments in the legal aspects of architectural, engineering, and the construction processes, this text is also a valuable reference for practitioners and has been cited in over twenty-five court decisions. Van de Castle examines the vital role that dreams have played throughout history, from the dreams of ancient Sumerian kings to the pioneering dream research of nineteenth-century psychologists. *Our Dreaming Mind* delves into the most provocative experiments that scientists are conducting on the dreaming mind in this century and surveys ongoing dream experiments: dreams and sexual arousal, the impact of pregnancy on dreams, the connection between dreams and creativity, and the possibility of paranormal dreams. "In *Our Dreaming Mind*, Robert Van de Castle pulls decades of accumulated wisdom together in a sweeping panorama unsurpassed in the literature for its scope, its insight, and its ability to captivate its readers.

"[A] scathing assessment . . . Berry shows that Wilson's much-celebrated, controversial pleas in *Consilience* to unify all branches of knowledge is nothing more than a fatuous subordination of religion, art, and everything else that is good to science . . . Berry is one of the most perceptive critics of American society writing today." —The Washington Post "I am tempted to say he understands [*Consilience*] better than Wilson himself . . . A new emancipation proclamation in which he speaks again and again about how to defy the tyranny of scientific materialism."—The Christian Science Monitor In *Life Is a Miracle*, the devotion of science to the quantitative and reductionist world is measured against the mysterious, qualitative suggestions of religion and art. Berry sees life as the collision of these separate forces, but without all three in the mix we are left at sea in the world.

The last two decades have seen a steady and impressive development, and eventual industrial acceptance, of the high energy-rate manufacturing techniques based on the utilisation of energy available in an explosive charge. Not only has it become economically viable to fabricate complex shapes and integrally bonded composites—which otherwise might not have been obtainable easily, if at all—but also a source of reasonably cheap energy and uniquely simple techniques, that often dispense with heavy equipment, have been made available to the engineer and applied scientist. The consolidation of theoretical knowledge and practical experience which we have witnessed in this area of activity in the last few years, combined with the growing industrial interest in the explosive forming, welding and compacting processes, makes it possible and also opportune to present, at this stage, an in-depth review of the state of the art. This book is a compendium of monographic contributions, each one of which represents a particular theoretical or industrial facet of the explosive operations. The contributions come from a number of practising engineers and scientists who seek to establish the present state of knowledge in the areas of the formation and propagation of shock and stress waves in metals, their metallurgical effects, and the methods of experimental assessment of these phenomena.

Android on x86: an Introduction to Optimizing for Intel® Architecture serves two main purposes. First, it makes the case for adapting your applications onto Intel's x86 architecture, including discussions of the business potential, the changing landscape of the Android marketplace, and the unique challenges and opportunities that arise from x86 devices. The fundamental idea is that extending your applications to support x86 or creating new ones is not difficult, but it is imperative to know all of the technicalities. This book is dedicated to providing you with an awareness of these nuances and an understanding of how to tackle them. Second, and most importantly, this book provides a one-stop detailed resource for best practices and procedures associated with the installation issues, hardware optimization issues, software requirements, programming tasks, and performance optimizations that emerge when developers consider the x86 Android devices. Optimization discussions dive into native code, hardware acceleration, and advanced profiling of multimedia applications. The authors have collected this information so that you can use the book as a guide for the specific requirements of each application project. This book is not dedicated solely to code; instead it is filled with the information you need in order to take advantage of x86 architecture. It will guide you through installing the Android SDK for Intel Architecture, help you understand the differences and similarities between processor architectures available in Android devices, teach you to create and port applications, debug existing x86 applications, offer solutions for NDK and C++ optimizations, and introduce the Intel Hardware Accelerated Execution Manager. This book provides the most useful information to help you get the job done quickly while utilizing best practices. What you'll learn
