This book documents the state of the art in the field of ambient assisted living (AAL), highlighting the impressive potential of novel methodologies and technologies to enhance well-being and promote active ageing. It covers a broad range of topics, with sections on technological sensors and platforms, social robotics for assistance, assistance and care applications, health and medical support methodologies and technologies, as well as the analysis, modelling and design of AAL services. The book comprises a selection of the best papers presented at the 8th Italian Forum on Ambient Assisted Living (ForitAAL 2017), which was held in Genoa, Italy, in June 2017 and brought together researchers, technology teams and professional associations, as well as representatives of the Italian regions and advisors to the Italian Ministry of Education, University and Research, with the goal of developing a consensus on how to improve provisions for the elderly and impaired. The respective contributions offer valuable insights into how the latest advances can help address the needs of the elderly and those with chronic health conditions. They also underscore the need for AAL to continue moving toward multidisciplinary integration, so as to embrace the various disciplines that place the user of services at the centre of the design process.

**Introduction and Purpose:** Good evidence shows that limiting hands-off time, and more specifically time between stopping compressions and actual defibrillation, directly affect the chance of success.(1,2) As part of evaluating our team training, our hypothesis was that, clinically, the defibrillator would be charged > 90% of the time, before compressions were halted for a rhythm check.**Materials and methods:** Using our database of in-hospital resuscitation attempts with a Philips MRx defibrillator, we reviewed all cases from Jan-2015 to Jan-2018 for rhythm check pauses and the timing of charging using QCPRReview2.1. Rhythms were evaluated as u2018shockableu2019 or u2018non-shockableu2019. Data collection and analysis with waived informed consent, were approved by our IRB (#P0968). **Results and discussion:** In 327 of 725 pauses (45%), charging was finished before compressions were stopped for the rhythm check. In 398 pauses, charging was ongoing or not started before compressions stopped. Teams without timely charging did not correct this during that case, regardless of rhythm or hinder. Late defibrillator charging increased the pause length by at least 5 seconds, often disrupting workflow and sometimes leading to danger for the caregiver performing manual chest compressions when they prematurely moved to restart compressions. Our results suggest undesirable training effects.(3)**Conclusions:** Despite regular scenario training, timely charging of the defibrillator is forgotten in real life. This disrupts workflow, teamwork and increases pause length and may also lead to dangerous situations as other team members are triggered to restart compressions rapidly. Scenario training should highlight real charging times. An uncharged defibrillator when compressions are stopped for a rhythm check should become a u201cSTOPu201d criterium in training. **References:**1.tHansen LK, et al.
