Fully-updated edition of this award-winning textbook, arranged by presenting complaints with full-color images throughout. For students, residents, and emergency physicians.

The aim of this book is to help the reader achieve the correct diagnosis in the emergency setting, which continues to remain a challenge, given the variety of potential clinical presentations. Diagnostic failure is the largest reason for delays in provision of appropriate treatment, which can be life-

saving, and the largest source of clinical complaints and untoward incidents leading to poor clinical outcomes and to litigation. In this book, the readers will find diagnostic checklists, organised according to potential emergency presentations and classified under body systems, including atypical presentations, lists of differential diagnoses and guidance to pattern recognition. Apart from providing an aide-memoire for a range of presentations, it is hoped that the book will allow for better quality and informed referrals, especially between health care providers. This book is aimed as a rapid reference guide for all levels of medical staff working in emergency and acute care settings in the English-speaking world, but may also benefit nursing professionals and medical students.

The book presents detailed information for both basic scientists and for clinicians seeing patients. It is also a stepping stone for new investigations and studies that goes beyond the facts about the composition and biochemistry of the connective tissue and extracellular matrix, as the authors connect individual components to specific aspects of various soft tissue disorders and to the actual or potential treatment of them. *Progress in Heritable Soft Connective Tissue Diseases* features very prominent physicians and scientists as contributors who bring their most recent discoveries to the benefit of readers. Their expertise will help clinicians with proper diagnosis of sometimes elusive and uncommon heritable diseases of soft connective tissues. This book also offers an update on the pathophysiology of these diseases, including an emphasis on unifying aspects such as connections between embryonic development of the different types of connective tissues and systems, and the role of TGF-beta in development and physiology of soft tissues. This new set of data explains, at least in part, why many of these disorders are interconnected, though the primary pathophysiological events, such as gene mutations, may be different for each disorder.

Short, concise summary of clinical and non-clinical aspects of obstetric analgesia and anaesthesia for trainees and seniors. This book uses a case-based approach to provide current information on a range of medical issues with the goal of enhancing preoperative evaluation and optimization. It meets the market need for a resource that concisely encapsulates current knowledge on the medical management of specific topics in a setting relevant to the preoperative clinic. In so doing the book aims to improve patient care and safety, enhance resource use, facilitate appropriate and timely management of preexisting conditions and diminish patient concerns. Organized into sections according to body system, each section consists of chapters delineating a specific disorder. Each chapter starts with a clinical vignette followed by a question-and-answer style investigation of the relevant issues. These questions attempt to address commonly encountered clinical dilemmas where opinion often differs between, and occasionally within, medical sub-specialties. Expertly written chapters are also supplemented by a number of chapters which address special considerations such as the frail patient and chronic opioid use. Preoperative Assessment: A Case-Based Approach is an invaluable reference for all physicians involved in preoperative assessment including anesthesiologists, surgeons, internists, family doctors and residents in these fields. This book is a comprehensive reference on diffuse cystic lung diseases (DCLDs). DCLDs are a group of pathophysiologically heterogeneous processes that are characterized by the presence of multiple spherical or irregularly shaped, thin-walled, air-filled spaces within the pulmonary parenchyma. In recent years, tremendous advancements have been made in these diseases leading to improved understanding of the underlying pathophysiology, and improved outcomes with targeted therapies. The authors, who are leading experts in the field, delineate DCLDs as a separate category distinct from other interstitial lung diseases, and have created this textbook specifically dedicated to this disease group. This book begins with a chapter introducing the definition and classification of DCLDs. Subsequent chapters address the pathogenic mechanisms underlying pulmonary cyst formation and provide a detailed overview of the radiological and pathological features of DCLDs. The common as well as uncommon causes of DCLDs are comprehensively reviewed in individual chapters, as are the varied clinical presentations and extrapulmonary manifestations, and approaches to management and treatment. The book culminates in a final chapter that presents a practical algorithmic approach to

diagnosis that progresses from least invasive to most invasive approaches. This textbook provides a one-stop, comprehensive and integrated, clinical, radiologic, and pathologic overview of DCLDs that will be as useful to the practicing clinician as it is to the clinical investigator.
