The philosophy of art, aesthetics, is here understood to be something distinct from both art appreciation and art criticism. The philosophy of art is never theless dependent upon the existence of appreciation and criticism because it is out of reflection upon these that the uniquely philosophical problems of art arise, problems that reflect puzzlement about what is involved in understanding, enjoying, describing, and evaluating works of art. Hence the philosophy of art must presuppose at least some measure of understanding and appreciation of particular works of art and if such understanding and appreciation are lacking the

philosopher is in no position to supply them. It can not be a philosophical task to undertake a Defense of Poesie against either the philistine or the tyrant. The philosopher is not the one to convince us that art is a Good Thing, that paintings are worth looking at, poems worth reading, and music worth listening to, if for no other reason than that philosophical theory and argument are no substitute for taste and sensibility. My position here is the now unexceptional one that philosophical problems are essentially conceptual problems and while the philosopher of art cannot produce aesthetic sensibility and appreciation where these do not exist, he can give us understanding of the concepts relevant to artistic appreciation and thereby help us to see our way through the conceptual confusions that have generated the philosophical puzzles surrounding art, its appreciation and criticism.

An authorised reissue of the long out of print classic textbook, *Advanced Calculus* by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of Harvard University has been a revered but hard to find textbook for the advanced calculus course for decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a certain amount of mathematical sophistication. As possible introductory texts, we mention *Differential and Integral Calculus* by R Courant, *Calculus* by T Apostol, *Calculus* by M Spivak, and *Pure Mathematics* by G Hardy. The reader should also have some experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.

University Physics is designed for the two- or three-semester calculus-based physics course. The text has been developed to meet the scope and sequence of most university physics courses and provides a foundation for a career in mathematics, science, or engineering. The book provides an important opportunity for students to learn the core concepts

of physics and understand how those concepts apply to their lives and to the world around them. Due to the comprehensive nature of the material, we are offering the book in three volumes for flexibility and efficiency. Coverage and Scope Our University Physics textbook adheres to the scope and sequence of most two- and three-semester physics courses nationwide. We have worked to make physics interesting and accessible to students while maintaining the mathematical rigor inherent in the subject. With this objective in mind, the content of this textbook has been developed and arranged to provide a logical progression from fundamental to more advanced concepts, building upon what students have already learned and emphasizing connections between topics and between theory and applications. The goal of each section is to enable students not just to recognize concepts, but to work with them in ways that will be useful in later courses and future careers. The organization and pedagogical features were developed and vetted with feedback from science educators dedicated to the project.
