Here is a new text that fulfills an emerging need in both higher and public education and stands to break new ground in addressing critical skills required of graduates. When working on their last book, It Works for Me, Creatively, the authors realized that the future belongs to the right-brained. While Daniel Pink and other visionaries may have oversimplified a bit, higher education is ripe for the creative campus, while secondary education is desperately seeking a complement to the growing assessment/teach-to-the-test mentality. You don't have to study the 2010 IBM survey of prominent American CEOs to know that the number one skill business wants is students who can think creatively. To meet the demand of new courses, programs, and curricula, the authors have developed a 200-page "textbook" suitable for secondary or higher education courses that are jumping on this bandwagon. Introduction to Applied Creative Thinking, as the title suggests, focuses not on just developing the skills necessary for creative thinking, but on having students apply those skills; after all, true creative thinking demands making something that is both novel and useful. Such a book may also be used successfully by professional developers in business and education. For this book, Hal Blythe and Charlie Sweet are joined in authorship by Rusty Carpenter. He not only directs Eastern Kentucky University's Noel Studio for Academic Creativity but has co-edited a book on that subject, Higher Education, Emerging Technologies, and Community

Partnerships (2011) and the forthcoming Cases on Higher Education Spaces (2012). Introduction to Applied Creative Thinking is student-friendly. Every chapter is laced with exercises, assignments, summaries, and generative spaces. Order copies now or contact the publisher for further information.

This book is about organisational development from a systemic perspective. It is about systemic principles. How do they work in organisations? And how do people in those organisations experience them? This book attempts to answer this and many more questions on working with the systemic phenomenological perspective in organisations and society at large. From the same perspective, this book discusses a large amount of issues such as fraud, success, downturn and succession. This book includes many examples of organisations and themes, including constellations in South America, Europe, Russia and the US. Together, they make this book to be a Lonely Planet in the world of working in the systemic-phenomenological way. Jan Jacob Stam, founder of the Hellinger Institute in The Netherlands, and a very welcome teacher and lecturer in more than twenty countries, has been a leader and researcher in the field of systemic work for over 15 years. This book gives you a look into Jan Jacob's experiences and insights. And as always, he has moved on and continues to develop and search for new insights. There are so many interesting questions still unanswered. This book reads like a dream on a cold winters' nights where no one sleeps and Jan Jacob keeps you awake as he makes you part of this special world.

Whether in freezing arctic tundra or blazing deserts, human beings have been figuring out how to adapt to hostile environments for centuries. New challenges emerge, however, as we venture to places where we are truly unable to exist without technology. When it comes to surviving underwater, a thorough knowledge of human physiology must be combined with a firm grasp of engineering principles, and Life Support Systems Design provides the student with an extensive grounding in both. A reference text for any beginning life support systems engineer, it also serves as a refresher course for more experienced divers. The text particularly emphasizes the effects of hyperbaric exposures on the diver's ability to function, but it also explores underwater physics, including the transport of light, heat, and gases, in detail. It reviews the practical technological aspects of life support system engineering, such as gas storage and delivery systems, and environmental control design. Finally, once the textbook has been absorbed, the authors encourage the student to design a life support system for a specified application. Armed with the knowledge gained from Life Support Systems Design, it seems like a project any student would ace.

Buried in the bowels of one of the several intelligence agencies in the US government is an office of clandestine medical personnel. Their mission is to analyze the health and mental state of international persons of interest and report their findings to America's policymakers. The team is on call 24/7 to comment on and analyze any written observations, pictures or videos of such persons of interest that may come into the hands of the U.S. government. The goal is to provide timely information to policymakers and negotiators so that the United States of America may achieve maximum success in dealing with the people concerned. Usually this is done in the safe confines of the Agency walls, but sometimes the analysts are forced to place themselves in harms way. Through it all and despite the circumstances, their Code of Honor is to Do No Harm.

What budding entrepreneur wants to be distracted by shopping for health insurance once a year, going through workers' compensation audits, sitting through unemployment hearings, stressing over an OSHA fine, creating employee handbooks, or paying out a big tax penalty because they didn't file something on time? A PEO handles all of this and more for its clients at a cost that is usually less than what the employer would pay by doing it themselves! We Are HR is the new HR handbook, designed to educate small business owners and industry professionals on the origins and future of PEOs, while highlighting the strong value proposition and overwhelming advantage small business owners have when leaving HR to the experts. The bottom line: when you have a tax problem, you call a CPA. If you have a legal problem, you call an attorney. And after reading this book, when you've got an HR problem, you'll call a PEO.

'One of the best software design books of all time' - BookAuthority Cory Althoff is a self-taught programmer. After a year of self-study, he learned to program well enough to land a job as a software engineer II at eBay. But once he got there, he realised he was severely under-prepared. He was overwhelmed by the amount of things he needed to know but hadn't learned. His journey learning to program, and his experience in first software engineering job were the inspiration for this book. This book is not just about learning to program, although you will learn to code. If you want to program professionally, it is not enough to learn to code; that is why, in addition to helping you learn to program, Althoff also cover the rest of the things you need to know to program professionally that classes and books don't teach you. The Self-taught Programmer is a roadmap, a guide to take you from writing your first Python program to passing your first technical interview. The book is divided into five sections: 1. Learn to program in Python 3 and build your first program. 2. Learn object-oriented programming and create a powerful Python program to get you hooked. 3. Learn to use tools like Git, Bash and regular expressions. Then use your new coding skills to build a web scraper. 4. Study computer science fundamentals like data structures and algorithms. 5. Finish with best coding practices, tips for working with a team and advice on landing a programming job. You can learn to program professionally. The path is there. Will you take it? From the author I spent one year writing The Self-Taught Programmer. It was an exciting and rewarding experience. I treated my book like a software project. After I finished writing it, I created a program to pick out all of the code examples from the book and execute them in Python to make sure all 300+ examples worked properly. Then I wrote software to add line numbers and color to every code example. Finally, I had a group of 200 new programmers 'beta read' the book to identify poorly explained concepts and look for any errors my program missed. I hope you learn as much reading my book as I did writing it. Best of luck with your programming!
