The possibility of harvesting the power of electric and magnetic impulses in the human body, commonly referred to as "neuromodulation," is one of the most recent and promising developments of the modern science. Since the late ´60s, multiple invasive and non-invasive technologies have been developed and tested in experimental and clinical settings with the final aim of modulating the function of the central and peripheral nervous system. Clinical applications include, but are not limited to, common neurological disorders such as Parkinson's disease and other movement disorders. The bulk of evidence supporting the clinical efficacy of various invasive and non-invasive approaches for neuromodulation has progressively led scientific societies, patients' associations, and regulatory entities to acknowledge the critical role played by neuromodulation in the therapeutic algorithms of a wide

range of neurological disorders. As a result, new technologies have been recently introduced into the market or are currently under validation. Their potential implementation into innovative protocols for neuromodulation demands a critical revision of what are the unmet needs for neuromodulation in movement disorders.
