Energy 2000, proceedings from the 8th in an international series of global energy forums, is now available in book format. These papers provide a broad-based perspective on not only technical energy developments, but a detailed examination into other aspects such as economic and policy assessments, global energy issues, energy efficiency and conservation, as well as architecture and international law. Also presented are individual and collected views on renewables, oil and gas, coal and nuclear. ENERGEX '2000, the 8th in an international series of global energy forums, was held in Las Vegas, July 23-28, 2000. The first in the series was held in Regina, Saskatchewan, Canada in cooperation, coordination and communication with technical societies, federal and provincial governments and industry. The majority of papers presented at the 8th global energy forum are contained in these proceedings and represent over 200 papers from 45 countries out of a total of over 400 accepted abstracts. These papers will provide the reader with a broad based perspective on not only technical energy developments but, as consistent with the International Energy Foundation's objectives, a detailed examination into other aspects such as economic and policy assessments, global energy issues such as global climatic change, energy efficiency and conservation, architecture and international law. ENERGEX '2000 also provided the opportunity for researchers internationally to present their individual and collected views related to the diverse sources of energy available to mankind. These sources include renewables, oil and gas, coal, and nuclear. From ENERGEX 2000 has resulted this new book! Since the inception of the ENERGEX series in 1982, an open door policy has been established so that any researcher from either the developed or the emerging nations will have an equal opportunity to present their individual or collected technical, economic or human dimensional assessments and analyses on an equal footing. Through this participation, researchers worldwide are provided with a wider range of opportunity to expand our horizons with respect to the continued use of fossil energies and nuclear energy combined with energy conservation and efficiency. This opens the door of opportunity in the 21st century with respect to the rapid developments and utilization of renewable energies and fuel cells. Integrated within this global energy forum were inputs from academia, industry and government on specific issues related to carbon sequestration, fuel cells, fossil fuels, hydrogen and the role of the present day energy standards of oil and gas, coal and nuclear energies In expanding the global energy picture, the Foundation developed the conference with the theme "Energy-International Cooperation, Coordination and Communication: The Beginning of a New Millennium." Consistent with this theme we are pleased that ENERGEX '2000 developed the program in concert with the Nevada Test Site Development Corporation (NTS).

This text provides background information, description, and analysis of four major cooling system technologies—vapor compression cooling, evaporative cooling, absorption cooling, and gas cooling. Vapor compression systems are currently the primary technology used in most standard domestic, commercial, and industrial cooling applications, as they have both performance and economic advantages over the other competing cooling systems. However, there are many other applications in which evaporative cooling, absorption cooling, or gas cooling technologies are a preferred choice. The main focus of the text is on the application of the thermal sciences to refrigeration and air conditioning systems. The goals are to familiarize the reader with cooling technology nomenclature, and provide insight into how refrigeration and air conditioning systems can be modeled and analyzed. Cooling systems are inherently complex, as the second law of thermodynamics does not allow thermal energy to be transferred directly from a lower temperature to a higher temperature, so the heat transfer is done indirectly through a thermodynamic cycle. Emphasis is placed on constructing idealized thermodynamic cycles to represent actual physical situations in cooling systems. The text also contains numerous practical examples to show how one can calculate the performance of cooling system components. By becoming familiar with the analyses presented in the examples, one can gain a feel for the representative values of the various thermal and mechanical parameters that characterize cooling systems.

This textbook provides a concise, systematic treatment of essential theories and practical aspects of refrigeration and air-conditioning systems. It is designed for students pursuing courses in mechanical engineering both at diploma and degree level with a view to equipping them with a fundamental background necessary to understand the latest methodologies used for the design of refrigeration and air-conditioning systems. After reviewing the physical principles, the text focuses on the refrigeration

cycles commonly used in air-conditioning applications in tropical climates. The subject of psychrometry for analysing the various thermodynamic processes in air conditioning is particularly dealt with in considerable detail. The practical design problems require comprehensive use of tables and charts prepared by the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE). This text incorporates such tables and charts so that the students are exposed to solving real-life design problems with the help of ASHRAE Tables. Finally, the book highlights the features, characteristics and selection criteria of hardware including the control equipment. It also provides the readers with the big picture in respect of the latest developments such as thermal storage air conditioning, desiccant cooling, chilled ceiling cooling, Indoor Air Quality (IAQ) and thermal comfort. Besides the students, the book would be immensely useful to practising engineers as a ready reference.

Refrigeration, air conditioning, and heat pumps (RACHP) have an important impact on the final energy uses of many sectors of modern society, such as residential, commercial, industrial, transport, and automotive. Moreover, RACHP also have an important environmental impact due to the working fluids that deplete the stratospheric ozone layer, which are being phased out according to the Montreal Protocol (1989). Last, but not least, high global warming potential (GWP), working fluids (directly), and energy consumption (indirectly) are responsible for a non-negligible quota of greenhouse gas (GHG) emissions in the atmosphere, thus impacting climate change.
