Case Studies and Clinical Simulations for Respiratory Care, 1st Edition, give students the most comprehensive and realistic review for the difficult Clinical Simulation Exam (CSE) portion of the NBRC registry exam. Featuring real-life patient management scenarios in a computerized test-taking environment modeled after the NBRC CSE experience, this versatile review prepares students to succeed both in the classroom and in the real-world clinical setting. UNIQUE! Clinical simulations offer real-life patient management scenarios that provide users with the chance to practice information gathering and decision making before taking the very difficult NBRC CSE portion of the RRT exam or before moving into the clinical setting. UNIQUE! Case Studies with

patient data records provide real-world samples of similar charted patient data you will likely see in the clinical setting. UNIQUE! Software compatibility makes the program ideal in various learning management system (LMS) environments and future 3PPs. Scoring scale similar to NBRC's CSE provides familiarity and practice for real-life testing. Software program recreates the NBRC CSE experience so that you can become more comfortable with the computer testing format, focus more on what is best for the patient and less on how the computer works. Branching logic format for the clinical simulations is similar to the testing feature used on the NBRC CSE, presenting a logical progression and creating a "cause and effect" style of learning. High-quality lung and heart sounds, radiographic images, waveforms, and other images provide realistic patient assessment data. NBRC-style multiple choice questions include rationales for both correct and incorrect answers to aid in content review and self-evaluation. Well-respected respiratory care author with vast experience in writing clinical simulations ensures that critical content is covered thoroughly and accurately. Examples of pathologic conditions, case studies and clinical simulations support key content found in any respiratory care program and support the NBRC CSE content outline.

Research Paper (undergraduate) from the year 2015 in the subject Health Science, grade: B, University of Manchester (HCRI), course: Global Health, language: English, abstract: At a local Hospital, an increased number of people admitted and treated for Respiratory Disease have been observed and most of them work at a local Factory. There is a concern that the dust generated by the machinery at the Company would be the contributing factor. A Case Control Study will be conducted on the Incidence of respiratory disease to prove or disapprove the association between the incident cases of respiratory disease and the exposure to the dust generated by the factory. The Research Protocol is adapted from the World Health Organization proposed study protocol format (WHO, 2014). The protocol will state the problem and the hypothesis generated to be tested, the aim and objectives to be achieved and the current knowledge on the topic in a literature review. A thorough explanation on the choice of the study design, methodology and sampling will be preceded by the study outcome and its measurement methods. Data collection and analysis using statistical methods with the potential sources of bias are elaborated. A discussion highlighting the pros and cons of this study as well as the study limitations are explained. A conclusive summary and Ethic statements followed by a list of References will shape the end of this study.

The emergence of severe acute respiratory syndrome (SARS) in late 2002 and 2003 challenged the global public health community to confront a novel epidemic that spread rapidly from its origins in southern China until it had reached more than 25 other countries within a matter of months. In addition to the number of patients infected with the SARS virus, the disease had profound economic and political repercussions in many of the affected regions. Recent reports of isolated new SARS cases and a fear that the disease could reemerge and spread have put public health officials on high alert for any indications of possible new outbreaks. This report examines the response to SARS by public health systems in individual countries, the biology of the SARS coronavirus and related coronaviruses in animals, the economic and political fallout of the SARS epidemic, quarantine law and other public health measures that apply to combating infectious diseases, and the role of international organizations and scientific cooperation in halting the spread of SARS. The report provides an illuminating survey of findings from the epidemic, along with an assessment of what might be needed in order to contain any future outbreaks of SARS or other emerging infections.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.

People are increasingly concerned about potential environmental health hazards and often ask their physicians questions such as: "Is the tap water safe to drink?" "Is it safe to live near power lines?" Unfortunately, physicians often lack the information and training related to environmental health risks needed to answer such questions. This book discusses six competency based learning objectives for all medical school students, discusses the relevance of environmental health to specific courses and clerkships, and demonstrates

With the aid of a series of instructive case studies, this book presents the characteristic high-resolution computed tomography (HRCT) findings seen in the group of disorders referred to as interstitial lung disease. The first, introductory part of the book explains the role of the multidisciplinary team in diagnosis and differential diagnosis and discusses basic pulmonary differential diagnosis, radiologic anatomy, and HRCT patterns. The second part is organized according to the four dominant types of HRCT pattern encountered in interstitial lung disease: low attenuation, linear opacities, nodular, and high attenuation. Within this classification, each disorder is introduced using a specific case, with detailed information on patient history, course of the illness, and laboratory and pulmonary function tests. HRCT findings are then presented, together with reflections of the multidisciplinary team, comprising a radiologist, a pulmonologist, and a pathologist. At the end of each case, comments are made on differential diagnosis, highlighting the role of HRCT. The book will be of high value for radiologists and pulmonologists at all levels of experience.

Cardiovascular, respiratory, and related conditions cause more than 40 percent of all deaths globally, and their substantial burden is rising, particularly in low- and middle-income countries (LMICs). Their burden extends well beyond health effects to include significant economic and societal consequences. Most of these conditions are related, share risk factors, and have common control measures at the clinical, population, and policy levels. Lives can be extended and improved when these diseases are prevented, detected, and managed. This volume summarizes current knowledge and presents evidence-based interventions that are effective, cost-effective, and scalable in LMICs.

Significant changes have taken place in the policy landscape surrounding cannabis legalization, production, and use.

During the past 20 years, 25 states and the District of Columbia have legalized cannabis and/or cannabidiol (a component of cannabis) for medical conditions or retail sales at the state level and 4 states have legalized both the medical and recreational use of cannabis. These landmark changes in policy have impacted cannabis use patterns and perceived levels of risk. However, despite this changing landscape, evidence regarding the short- and long-term health effects of cannabis use remains elusive. While a myriad of studies have examined cannabis use in all its various forms, often these research conclusions are not appropriately synthesized, translated for, or communicated to policy makers, health care providers, state health officials, or other stakeholders who have been charged with influencing and enacting policies, procedures, and laws related to cannabis use. Unlike other controlled substances such as alcohol or tobacco, no accepted standards for safe use or appropriate dose are available to help guide individuals as they make choices regarding the issues of if, when, where, and how to use cannabis safely and, in regard to therapeutic uses, effectively. Shifting public sentiment, conflicting and impeded scientific research, and legislative battles have fueled the debate about what, if any, harms or benefits can be attributed to the use of cannabis or its derivatives, and this lack of aggregated knowledge has broad public health implications. The Health Effects of Cannabis and Cannabinoids provides a comprehensive review of scientific evidence related to the health effects and potential therapeutic benefits of cannabis. This report provides a research agenda—outlining gaps in current knowledge and opportunities for providing additional insight into these issues—that summarizes and prioritizes pressing research needs. Presented as a large collection of case studies, this book is a complete guide to respiratory medicine for pulmonologists
