Samsung has again made its mark in the mobile field with the release of the latest Samsung Galaxy phones. The Samsung Galaxy S7 and S7 Edge were launched to the public in February of 2016 and are expected to be released for purchase by early March of the same year. The new models have received rave reviews and Samsung commended for maintaining the high quality and impressive features usually associated with the brand. Though the devices bear different names, the features they offer users are similar in nature. The S7 boasts a 5.1-inch screen with resolution of 2,560 by 1,440 pixels, a twelve-megapixel camera, IP68 water resistant rating, built-in storage capacity of up to 64GB and microSD card slot. The S7 Edge has a 3600mAh battery, the largest battery in the S line of phones, 5.5-inch screen with dual edge technology and a 12megapixel rear camera.

This volume introduces a series of different data-driven computational methods for analyzing group processes through didactic and tutorial-based examples. Group processes are of central importance to many sectors of society, including government, the military, health care, and corporations. Computational methods are better suited to handle (potentially huge) group process data than traditional methodologies because of their more flexible assumptions and capability to handle real-time trace data. Indeed, the use of methods under the name of computational social science have exploded over the years. However, attention has been focused on original research rather than pedagogy, leaving those interested in obtaining computational skills lacking a much needed resource. Although the methods here can be applied to wider areas of social science, they are specifically tailored to group process research. A number of data-driven methods adapted to group process research are demonstrated in this current volume. These include text mining, relational event modeling, social simulation, machine learning, social sequence analysis, and response surface analysis. In order to take advantage of these new opportunities, this book provides clear examples (e.g., providing code) of group processes in various contexts, setting guidelines and best practices for future work to build upon. This volume will be of great benefit to those willing to learn computational methods. These include academics like graduate students and faculty, multidisciplinary professionals and researchers working on organization and management science, and consultants for various types of organizations and groups.
