Unique and informative, Water Properties of Food, Pharmaceutical, and Biological Materials is based on lectures and papers given by leading international researchers at the 9th International Symposium of the Properties of Water in Foods (ISOPOW 9) that took place in September 2004. Each chapter presents an authoritative account of the latest research on the physical and chemical properties of water in relation to the stability of food, pharmaceutical, and biological materials. The first part of the text focuses on presentations given by invited speakers, whereas the second part is dedicated to oral presentations and discussions. Topics include the role of water in structural and functional properties, preserving biomolecule functionality in restricted water environments, and micro- and nano- techniques used for assessing water-solid interactions in food and drug development. This book is an invaluable resource that synthesizes cutting-edge information with innovative viewpoints from internationally esteemed researchers who participated in ISOPOW 2004.

Types and Properties of Water in two volumes is a component of Encyclopedia of Water Sciences, Engineering and Technology Resources in the global Encyclopedia of Life Support Systems (EOLSS), which is an integrated compendium of twenty one Encyclopedias. These volumes deal with different parts of the hydrosphere and features of water as substance in its three phases. Natural water is one of the most important substances for the maintenance of life on our planet. The main part of the Earth's water is concentrated in the hydrosphere (oceans, lakes, streams, underground water), and in the cryosphere (all the snow and ice). The atmosphere and living organisms also contain water, but in minor quantities as compared to the whole hydrosphere. Several types of water are in the Nature: atmospheric water, water in oceans, seas, coastal zones, and estuaries; in rivers, reservoirs, lakes and wetlands; groundwater including soil waters; glaciers, icebergs, and ground ice (permafrost). This set of volumes is designed to be a very authoritative reference for state-of-the-art knowledge on the various aspects such as:

Characteristics of Water and Water Bodies in the Natural Environment; Properties of Atmospheric Water; Properties of Oceans, Inland Seas, Coastal Zones, and Estuaries; Properties of Rivers, Streams, Lakes and Wetlands; Properties of Soil Water and Groundwater; Properties Of Glacial, Iceberg And Permafrost Water. These two volumes are aimed at the following five major target audiences: University and College students Educators, Professional practitioners, Research personnel and Policy analysts, managers, and decision makers and NGOs.

As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

These steam tables have been calculated using the international standard for the thermodynamic properties of water and steam, the IAPWS-IF97 formulation, and the international standards for transport and other properties. In addition, the complete set of equations of IAPWS-IF97 is presented including all supplementary backward equations adopted by IAPWS between 2001 and 2005 for fast calculations of heat cycles, boilers, and steam turbines.

This booklet is an ideal supplement for any course in thermodynamics or the thermal fluid sciences and a handy reference for the practising engineer. The tables in the booklet complement and extend the property tables in the appendices to Stephen Turn's Thermodynamics: Concepts and Applications and Thermal-Fluid Sciences: An Integrated Approach. In addition to duplicating the SI tables in these books it extends the tables to cover US customary units as well. The booklet also contains property data for the refrigerant R-134a and properties of the atmosphere at high altitudes.

The authors have correlated many experimental observations and theoretical discussions from the scientific literature on water. Topics covered include the water molecule and forces between water molecules; the thermodynamic properties of steam; the structures of the ices; the thermodynamic, electrical, spectroscopic, and transport properties of the ices and of liquid water; hydrogen bonding in ice and water; and models for liquid water. The main emphasis of the book is on relating the properties of ice and water to their structures. Some background material in physical chemistry has been included in order to ensure that the material is accessible to readers in fields such as biology, biochemistry, and geology, as well as to chemists and physicists.

Seawater: Its Composition, Properties and Behaviour provides a comprehensive introduction to marine science. This book is divided into seven chapters. Chapter 1 summarizes the special properties of water and the role of the oceans in the hydrological cycle. The distribution of temperature and salinity in the oceans and their combined influence on density, stability, and vertical water movements are discussed in Chapters 2 to 4. The fifth chapter describes the behavior of light and sound in seawater and provides examples of the application of acoustics to oceanography. Chapter 6 examines the composition and behavior of the dissolved constituents of seawater, covering minor and trace constituents and major ions, as well as dissolved gases and biologically important nutrients. Residence times, speciation, and carbonate equilibria are also deliberated. The last chapter provides a short review of ideas about the history of seawater, involvement of the oceans in global cycles, and their relationship to climatic change. This publication is beneficial to oceanographers and marine biologists, including students that are interested in marine science.

Water is recognized as being a critically important determinant of the properties of many foods. It is therefore appropriate to devote a meeting to the topic. The first such meeting was organized by the late Ron Duckworth, and held in 1974 at the University of Strathclyde in Scotland. As a result of this first meeting, the organization known as International Symposium on the Properties of Water (ISOPOW) was born, and since that first ISOPOW meeting there have been five international meetings. At each meeting, participants from academia and from industry have shared state of the science information pertinent to the role of water in foods. Each meeting has served as a review of the current state of knowledge. ISOPOW 6 is the first of these meetings where Ron Duckworth's presence has not been felt, though he clearly attended the meeting in spirit. A lively group of academics and industrial scientists assembled in Santa Rosa, California, to discuss the current state of the science. As meeting chairperson, I must acknowledge the tremendous contributions made by the organizing committee, by the session chairpersons and by the central committee. Without all their help, nothing could have been achieved. Most important to the success of the meeting, however, was the very active participation of all attendees. In all seven sessions, the papers were excellent and their discussion was very spirited.

Astronomy and Astrophysics Abstracts, which has appeared in semi-annual volumes since 1969, is devoted to the recording, summarizing and indexing of astronomical publications throughout the world. It is prepared under the auspices of the International Astronomical Union (according to a resolution adopted at the 14th General Assembly in 1970). Astronomy and Astrophysics Abstracts aims to present a comprehensive documentation of literature in all fields of astronomy and astrophysics. Every effort will be made to ensure that the average time interval between the date of receipt of the original literature and publication of the abstracts will not exceed eight months. This time interval is near to that achieved by monthly abstracting journals, compared to which our system of accumulating abstracts for about six months offers the advantage of greater convenience for the user. Volume 18 contains literature published in 1976 and received before March 1, 1977; some older literature which was received late and which is not recorded in earlier volumes is also included.

Whenever a student decides to prepare for any examination, her/his first and foremost curiosity arises about the type of questions that he/she has to face. This becomes more important in the context of JEE Advanced where there is neck-to-neck race. For this purpose, we feel great pleasure to present this book before you. The book also treats the surface properties of apolar and polar molecules, polymers, particles and cells, as well as their mutual interaction energies, when immersed in water, under the influence of the three prevailing non-covalent forces, i.e., Lewis acid-base (AB), Lifshitz-van der Waals (LW) and electrical double layer (EL) interactions. The polar AB interactions, be they attractive or repulsive, typically represent up to 90% of the total interaction energies occurring in water. Thus the addition of AB energies to the LW + EL energies of the classical DLVO theory of energy vs. distance analysis makes this powerful tool (the Extended DLVO theory) applicable to the quantitative study of the stability of particle suspensions in water.-

This book is a research monograph summarizing recent advances related to the molecular structure of water and ice, and it is based on the latest spectroscopic data available. A special focus is given to radio- and microwave frequency regions. Within the five interconnected chapters, the author reviews the electromagnetic waves interaction with water, ice, and moist substances, discussing the microscopic mechanisms behind the dielectric responses. Well-established classic views concerning the structure of water and ice are considered along with new approaches related to atomic and molecular dynamics. Particular attention is given to nanofluidics, atmospheric science, and electrochemistry. The mathematical apparatus, based on diverse approaches employed in condensed matter physics, is widely used and allows the reader to quantitatively describe the electrodynamic response of water and ice in both bulk and confined states. This book is intended for a wide audience covering physicists, electrochemists,

geophysicists, engineers, biophysicists, and general scientists who work on the electromagnetic radiation interaction with water and moist substances.
