This monograph reviews all relevant technologies based on mass spectrometry that are used to study or screen biological interactions in general. Arranged in three parts, the text begins by reviewing techniques nowadays almost considered classical, such as affinity chromatography and ultrafiltration, as well as the latest techniques. The second part focusses on all MS-based methods for the study of interactions of proteins with all classes of biomolecules. Besides pull down-based approaches, this section also emphasizes the use of ion mobility MS, capture-compound approaches, chemical proteomics and interactomics. The third and final part discusses other important technologies frequently employed in interaction studies, such as biosensors and microarrays. For pharmaceutical, analytical, protein, environmental and biochemists, as well as those working in pharmaceutical and analytical laboratories.

Antibody phage display, the definitive technology for monoclonal production, has now advanced to a stage where it can be performed in nonspecialized research laboratories. In *Antibody Phage Display: Methods and Protocols*, Philippa M. O'Brien and Robert Aitken combine in one volume a comprehensive collection of established antibody phage display protocols, each accompanied by

authoritative guidance that will enable the nonspecialist to carry them out successfully. Coverage spans the construction of antibody libraries, the selection of antibody clones with the desired properties, and their modification, expression, and purification. Each readily reproducible method is described by a hands-on expert in step-by-step detail and includes a wealth of practical advice not found in the scientific literature. Extensive notes discuss pitfalls to avoid and offer many possible alternative methods to suit special research situations. An overview by one of the world's leading experts in antibody phage display, Dr. Hennie R. Hoogenboom, surveys the current status of the field and the future of the technology. Comprehensive and highly practical, *Antibody Phage Display: Methods and Protocols* provides biochemists, molecular biologists, and immunologists with a gold-standard reference guide to the successful isolation, modification, and expression of recombinant antibodies using today's powerful phage display technology. This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.
